## ABSTRACT S.

*Ratio of Injured to Killed amongst Engine-Drivers, Stokers, and Guards, from different causes.*

| CAUSES.                                                             | Killed. | Injured. | Ratio of Injured to Killed. |
|---------------------------------------------------------------------|---------|----------|-----------------------------|
| Collisions, running off line, and }<br>Collisions at stations . . } | 70      | 118      | 168.57 per cent.            |
| All other causes . . . . .                                          | 246     | 199      | 80.89 ...                   |

It is hence obvious, not only as regards employés, but also passengers, that accidents from "collisions," and from "running off the line," are neither so frequent nor so fatal as has been hitherto so generally believed by the public.

The next point connected with this part of the inquiry, to which attention is directed, is the relative frequency of fatal accidents in recent and more remote years; and, for the purpose of ascertaining how far the tendency to fatal accidents has increased or diminished amongst employés, the following Abstract has been prepared, which shews the deaths from all causes in the aggregate among

## ABSTRACT T.

| PERIOD.       | Engine Drivers, Stokers and Guards. |         |               | Porters and other Servants. |         |               |
|---------------|-------------------------------------|---------|---------------|-----------------------------|---------|---------------|
|               | Number Exposed to Risk.             | Killed. | One Killed in | Number Exposed to Risk.     | Killed. | One Killed in |
| 1840 to 1843  | 6,080                               | 27      | 225           | 54,134                      | 99      | 547           |
| 1844 ... 1847 | 10,852                              | 100     | 109           | 96,548                      | 223     | 433           |
| 1848 ... 1851 | 23,454                              | 148     | 158           | 209,000                     | 361     | 579           |
| 1852 . . . .  | 7,252                               | 41      | 177           | 64,619                      | 82      | 788           |
| 1840 to 1852  | 47,638                              | 316     | 151           | 424,301                     | 765     | 555           |

When a similar investigation was made into the relative frequency of fatal accidents to passengers, in Abstract H, it was most satisfactory to find so rapid and so decided a diminution of them in recent years. But, although in the present instance it would appear that, among railway servants, the mortality from accidents was not so high in the first as in the period immediately succeeding, still it is gratifying to find a still more marked and decided diminution in the rate of mortality among railway servants since the year 1844, than has taken place even amongst passengers. According to Abstract H, it will be found that the decrease in mortality of passengers, within the same period, was in the ratio of one in 230 to one in 289; while, amongst the group "Engine Drivers, Stokers, and Guards," the decrease has been in the ratio of one in 109 to one in 177; but if the ratio had been in accordance with that for passengers, it would have been as 109 to 137 only. Again, in the group "Porters and other Servants," the decrease of mortality has been as one in 433 to one in 788; but if the ratio had been the same as that for passengers, it would

have been as one in 433 to one in 544 only. It will thus be seen that the diminution of fatal accidents among the second group of railway servants is somewhat greater than in even the first group.

Few, if any persons, were, until recently, distinctly aware of the great diminution of fatal accidents amongst railway passengers; but the facts in Abstract H, of the former paper, have now sufficiently established the truth of the great improvements in this respect of railway travelling in recent years; and the evidence now brought forward in Abstract T is of a still more satisfactory and welcome nature; for while, in the period under review, the mortality of railway passengers has diminished 21 per cent., that of railway servants, taking both groups, has, in the same time, decreased no less than 78 per cent. It must hence be evident to every inquirer that great improvement in the management of the railway system of this country has taken place within the last ten years, to whatever cause that improvement may be due. The risk of life and limb has greatly diminished among all classes, whether travellers or employés.

In the former part of this paper, an ample illustration was given of the distinction intended to be drawn between accidents "beyond control of the companies" and those "under control of the companies;" and that part of the question was sufficiently discussed, so far as passengers are concerned. It is now proposed to investigate it in relation to employés.

The following Abstract furnishes the principal facts for the period 1840-51:—

#### ABSTRACT U.

*Deaths amongst Employés from causes Beyond Control of Companies, also from causes Under Control of Companies, 1840—51.*

| Causes.                                                           | Class of Persons. |          |          |          |         |          |          |          |                 |          |
|-------------------------------------------------------------------|-------------------|----------|----------|----------|---------|----------|----------|----------|-----------------|----------|
|                                                                   | Engine Drivers.   |          | Stokers. |          | Guards. |          | Porters. |          | Other Servants. |          |
|                                                                   | Killed.           | Injured. | Killed.  | Injured. | Killed. | Injured. | Killed.  | Injured. | Killed.         | Injured. |
| (a)—Beyond control of the Companies                               | 24                | 31       | 56       | 42       | 61      | 27       | 46       | 15       | 438             | 143      |
| (b)—Under control of the Companies, including Miscellaneous . . . | 38                | 53       | 42       | 64       | 54      | 57       | 52       | 41       | 147             | 141      |
| Per centage of (a) .                                              | 38·71             | 36·90    | 57·14    | 39·62    | 53·04   | 32·14    | 46·94    | 26·79    | 74·87           | 50·35    |
| Per centage of (b) .                                              | 61·29             | 63·10    | 42·86    | 60·38    | 46·96   | 67·86    | 53·06    | 73·21    | 24·13           | 49·65    |

In Abstract I, page 258 *ante*, the fatal accidents to passengers, assumed to be "under control" of the companies, were found to be 55·3 per cent. of the whole; but in this Abstract it will be seen, that, with the exception of the class "Engine Drivers," the ratio of accidents "under control of the companies" is, on the whole, considerably under that for passengers. In the preceding Abstract, the accidents in the miscellaneous

or unclassified group are placed among those "under control of the companies;" but the more correct mode of comparison is clearly, for the reasons assigned in page 259 *ante*, to exclude them; and, therefore, in the next Abstract, which has been prepared to shew whether the accidents, assumed to arise from causes "under control of the companies," be increasing or diminishing, the miscellaneous group is not taken into account:—

## ABSTRACT V.

*Deaths among Different Classes of Employés, shewing those from causes beyond the Control of the Companies, and those not under such Control.*

| Causes.                                                 | Engine Drivers, Stokers and Guards. |          |          | Porters and Other Servants. |          |          |
|---------------------------------------------------------|-------------------------------------|----------|----------|-----------------------------|----------|----------|
|                                                         | 1840-43.                            | 1844-47. | 1848-51. | 1840-43.                    | 1844-47. | 1848-51. |
| Beyond control of Company .                             | 19                                  | 44       | 78       | 80                          | 177      | 227      |
| Under control of Company, excluding Miscellaneous . . } | 3                                   | 36       | 42       | 15                          | 32       | 77       |
| Mortality per Cent. of each Class to the Total.         |                                     |          |          |                             |          |          |
| Beyond control of Company . .                           | 86.37                               | 55.00    | 65.00    | 84.21                       | 84.69    | 74.67    |
| Under control of Company, excluding Miscellaneous . . } | 13.63                               | 45.00    | 35.00    | 15.79                       | 15.31    | 25.33    |

If the results in this be compared with those in the preceding Abstract, a very important distinction will be observable, the ratio of accidents assumed as "under control of the companies" being very much less, in consequence of the group of accidents in the miscellaneous or undefined groups being excluded. But there is one feature appearing in Abstract V of anything but a satisfactory nature, namely, that the ratio of accidents "under control of the companies," in reference to the total deaths from all causes, have, contrary to that which was found to prevail in Abstract J in regard to passengers, been increasing. In page 256 *ante*, however, while describing Table XXI, it was clearly shewn that, although such modes of exhibiting the relation of statistical facts have their uses, serious objections may still be brought against them when any exact or strict investigation is attempted. In order, therefore, to avoid such objections, the following Table has been prepared on the plan of Abstract K, and similar in some respects to Table XXXV, only that the accidents arising from causes "under control of companies" are distinguished from those considered as "beyond the control of companies." The first section shews the ratio of deaths from causes "beyond" and "under" control of the companies, in the same manner as that followed in Abstract V, only more in detail; but the second section of the same Table furnishes the exact ratio of mortality per annum to the numbers exposed to risk in each class of employés:—

[The second

*Number and Ratio per Cent. of Deaths from causes Beyond and Under Control of the Companies to the Total Deaths from all ascertained causes, for each Class of Employés.*

*Exact Rate of Mortality per Annum to the Number Exposed to Risk in each Class.*

| Causes.                                            | Deaths of Engine Drivers. |               |               | Deaths of Stokers. |               |               | Deaths of Guards. |               |               | Deaths of Porters. |                 |                 | Deaths of other Servants. |               |               |

| Ratio of, Beyond control<br>of Companies . . . . . | One in<br>342             | One in<br>457 | One in<br>791 | One in<br>354      | One in<br>181 | One in<br>283 | One in<br>272     | One in<br>226 | One in<br>188 | One in<br>1,123    | One in<br>1,069 | One in<br>1,508 | One in<br>627             | One in<br>497 | One in<br>855 |
| Ratio of, Under control of<br>Companies . . . . .  | 2,051                     | 215           | 719           | 2,127              | 292           | 547           | 1,902             | 566           | 459           | 1,497              | 1,326           | 1,734           | 5,017                     | 4,026         | 3,058         |

The second section of this Table is calculated to throw important light on the question of railway accidents, as they affect the different classes of employés, both as regards the causes "beyond control of the companies" and those assumed to fall "under control of the companies." In describing Abstract T, it was pointed out that, ever since 1844, the accidents from all causes have been diminishing; so also, in the preceding Table, it will be found that generally in each class of servants the fatal accidents have been decreasing within the same period, whether viewed in respect to the causes "beyond control of the companies" or otherwise, the exceptions being in the group of "guards," and in the group of "other servants" for accident from causes "under control of companies." The following Abstract, however, of this Table will place the question in a clearer light:—

## ABSTRACT W.

*Ratio of Deaths amongst Employés from causes Beyond and Under Control of the Companies, 1840-51.*

|                                                    | Engine Drivers,<br>Stokers, and Guards. |                     |                     | Porters and other Servants. |                     |                     | Engine Drivers,<br>Stokers, Guards, Porters, and<br>other Servants. |                     |                     |

| Under control of Companies                         | 3                                       | 36                  | 42                  | 15                          | 32                  | 77                  | 18                                                                  | 68                  | 119                 |
| Ratio of, Beyond control of<br>Companies . . . . . | One in<br>320                           | One in<br>247       | One in<br>301       | One in<br>677               | One in<br>545       | One in<br>921       | One in<br>608                                                       | One in<br>486       | One in<br>762       |
| Ratio of, Under control of<br>Companies . . . . .  | 2,027                                   | 302                 | 558                 | 3,609                       | 3,017               | 2,714               | 3,345                                                               | 1,579               | 1,953               |

It is thus obvious that, so far as engine-drivers, stokers, and guards are concerned, there has been a decided decrease in the accidents, both from causes "beyond" and "under" control of the companies, and, consequently, an absolute decrease in the mortality from all causes; but in the case of porters and other servants, it will be found that, while the deaths from causes "beyond the control of companies" have diminished in a very marked manner, those from causes "under control of the companies" have increased. In the last section of the preceding Abstract, it will, however, be seen that, viewing all the railway employés in the aggregate, there has been a decided decrease in the deaths from both classes of accidents, whether from causes beyond or under control of the companies. In Abstract K, it will be found that, among passengers, although the deaths from all causes had largely decreased since 1844, still those from causes "beyond the control of the companies," in that period, increased, but not in so great a ratio as the deaths from causes "under the control of the companies," had diminished. The decrease from causes "under the control of the companies," it will be observed, by comparing the results of Abstract R for passengers with those of Abstract W for employés, is very nearly

the same within the period 1844-51. From the principle on which Tables XXXI, XXXII, and XXXIII, have been formed, it is questionable whether the number of employés therein deduced as being in the service of the companies prior to the year 1844, can be safely relied on, although subsequent to that period they may be considered as strictly applicable to the purposes to which they have been applied in this contribution; in fact, subsequent to 1847, a census has been taken in the alternate years. Looking, however, at the figures determined for the years 1840-43, it is to be doubted whether the number of employés then in actual service was not much less than stated in the Tables just referred to. For other reasons than those appearing from an examination of the figures in Table XXXIII, it may be fairly assumed that, in the early period of railway management, a less number of employés was required in the railway service, *pro rata* to the extent of the line of railway open to traffic; for it has already been shewn, in the early part of this communication, that both the passenger and goods traffic have increased in a much higher ratio than the extent of miles of railway open for traffic, and, consequently, the number of railway employés has also increased in a like high ratio. This is an important consideration to bear in mind while engaged on this part of the inquiry which relates to employés only. The same difficulty did not arise while engaged in the examination of a similar question in respect to passengers, for the number of passengers and the extent of mileage were known for each year of the whole period under observation; but, as already stated, no census of railway employés was available for the purpose of this inquiry until May, 1848. Assuming that the remarks now advanced, in respect to the estimated number of employés given in Table XXXIII, are generally correct, it will follow that the actual rate of mortality among railway employés, for the period 1840-43, was much greater than that shewn in the preceding Tables and Abstracts, and hence, in the present state of the investigation of this question, it would be difficult to assert positively whether, as in the case of passengers, the mortality of employés has not also uniformly diminished ever since 1840, notwithstanding the indications to the contrary contained in Table XXXVI and Abstract W.

Whatever opinions may be held as to the improvements likely to take place in railway management for the future, for the protection of the lives of passengers and employés, one thing is quite certain, that in the period within which observations and recorded facts may be safely relied on, great improvements must have been effected in the management of railway affairs; and more credit is due to those intrusted with the conduct of these matters than either the public press or the people of this country have for a long time seemed disposed to accord to them.

In pages 260-1 *ante*, will be found important facts and deductions in relation to "collisions;" and although that portion of the inquiry had special reference to passengers, many of the observations are equally applicable to the case of employés. The following Table exhibits the number of deaths taking place from collisions at stations, and from collisions not at stations, during the period 1844-51:—

[It will be

TABLE XXXVII.

*The Number and Ratio of Deaths from Collisions happening at Stations, and from Collisions not at Stations, during the Years 1844-52, among*

| Period.                 | Engine Drivers. |                 |        |             |        |
|-------------------------|-----------------|-----------------|--------|-------------|--------|
|                         | Number.         | Not at Station. |        | At Station. |        |
|                         |                 | Killed.         | One in | Killed.     | One in |
| 1844 to 1847 . . . . .  | 3,658           | 4               | 914    | 2           | 1,829  |
| 1848 ... 1851 . . . . . | 7,910           | 2               | 3,955  | 1           | 7,910  |

| Period.                 | Guards.         |                 |        |             |        |
|                         | Number.         | Not at Station. |        | At Station. |        |
|                         |                 | Killed.         | One in | Killed.     | One in |
| 1844 to 1847 . . . . .  | 3,394           | 2               | 1,697  | 1           | 3,394  |
| 1848 ... 1851 . . . . . | 7,339           | 1               | 7,339  | 3           | 2,446  |
| 1852 . . . . .          | 2,269           | ...             | ...    | ...         | ...    |
| 1844 to 1852 . . . . .  | 13,002          | 3               | 4,334  | 4           | 3,251  |
| Period.                 | Porters.        |                 |        |             |        |
|                         | Number.         | Not at Station. |        | At Station. |        |
|                         |                 | Killed.         | One in | Killed.     | One in |
| 1844 to 1847 . . . . .  | 16,037          | ...             | ...    | 2           | 8,018  |
| 1848 ... 1851 . . . . . | 34,677          | ...             | ...    | 1           | 34,677 |
| 1852 . . . . .          | 10,722          | ...             | ...    | 1           | 10,722 |
| 1844 to 1852 . . . . .  | 61,436          | ...             | ...    | 4           | 15,359 |
| Period.                 | Other Servants. |                 |        |             |        |
|                         | Number.         | Not at Station. |        | At Station. |        |
|                         |                 | Killed.         | One in | Killed.     | One in |
| 1844 to 1847 . . . . .  | 80,511          | 2               | 40,255 | 1           | 80,511 |
| 1848 ... 1851 . . . . . | 174,323         | 4               | 43,581 | 7           | 24,903 |
| 1852 . . . . .          | 53,897          | 5               | 10,779 | ...         | ...    |
| 1844 to 1852 . . . . .  | 308,731         | 11              | 28,066 | 8           | 38,591 |

It will be seen that this class of accidents, which, in the case of passengers, was shewn, at page 260, to constitute nearly 59 per cent. of all accidents assumed to be under the control of the companies, does, in regard to employés, amount to little more than 21 per cent. of all the accidents arising from causes under the control of the companies; and this is a distinction which it is of much importance to keep in view, as it is calculated to throw much light on the proximate cause of accidents in railways, and the direction in which improvements are more immediately to be looked for. With this object in view, the following Abstract has been prepared, shewing, in reference to the causes assumed to be under control of the companies, the degree in which each particular class of employés is subject to each kind of accident, as well as the relation between each class of employés, and also all employés in the aggregate, to passengers in this respect:—

#### ABSTRACT X.

*The Number of Deaths amongst Railway Employés, and amongst Passengers, during the Years 1840-52, from Accidents under Control of the Companies.*

| CAUSE OF ACCIDENT.     | Class of Employés. |          |         |          |                 |                    | Passengers. |
|------------------------|--------------------|----------|---------|----------|-----------------|--------------------|-------------|
|                        | Engine Drivers.    | Stokers. | Guards. | Porters. | Other Servants. | Total of Employés. |             |
| Collision . . . . .    | 6                  | 8        | 3       | ...      | 11              | 28                 | 29          |
| Off line . . . . .     | 19                 | 13       | 6       | 1        | 6               | 45                 | 35          |
| Running into station . | 1                  | ...      | ...     | ...      | ...             | 1                  | 5           |
| Collision at station . | 6                  | 5        | 4       | 4        | 8               | 27                 | 35          |
| Crushed . . . . .      | 3                  | 13       | 14      | 41       | 72              | 143                | 5           |
| Total . . . . .        | 35                 | 39       | 27      | 46       | 97              | 244                | 109         |

Accidents from collisions are, relatively to the whole of the above class of accidents, obviously not so fatal to any one class of railway servants, nor consequently to the whole collectively, as to passengers.

In the former part of this paper a very complete investigation has been made of the various circumstances under which collisions took place, distinguishing those collisions at stations from those not at stations, and also those in which the immediate cause was the state of the weather, defects in machinery, neglect, and other circumstances; besides, it was further shewn to what extent the various accidents from collisions arose from passenger trains running into other passenger trains, from passenger trains into trains of another sort, from trains other than passenger trains into passenger trains, and from trains, neither of which were passenger trains. And although the data there brought forward have more especial reference to the injuries sustained by passengers, the facts are quite as completely given in regard to employés themselves; and it is therefore now unnecessary to enlarge on the particular questions then discussed. In respect, however, to the preceding Abstract of this group of accidents, namely, those assumed to be under control of the

companies, the following modification in the way of exhibiting the results will shew the relative frequency of each kind of accident to all causes of the same group of accidents.

## ABSTRACT Y.

*Ratio of Deaths amongst each Class of Railway Employés and amongst Passengers, during the Years 1840—52, from each kind of Accident Under Control of the Companies, to the Deaths from all causes assumed as being Under Control of the Companies.*

| CAUSE OF ACCIDENT.     | Class of Employés. |          |         |          |                 |                    | Passengers. |
|------------------------|--------------------|----------|---------|----------|-----------------|--------------------|-------------|
|                        | Engine Drivers.    | Stokers. | Guards. | Porters. | Other Servants. | Total of Employés. |             |
| Collision . . . . .    | 17·14              | 20·52    | 11·11   | ...      | 11·34           | 11·47              | 26·60       |
| Off line . . . . .     | 54·29              | 33·33    | 22·22   | 2·17     | 6·18            | 18·44              | 32·11       |
| Running into station . | 2·86               | ...      | ...     | ...      | ...             | 0·41               | 4·59        |
| Collision at station . | 17·14              | 12·82    | 14·82   | 8·70     | 8·25            | 11·07              | 32·11       |
| Crushed . . . . .      | 8·57               | 33·33    | 51·85   | 89·13    | 74·23           | 58·61              | 4·59        |

The following are the causes amongst those assumed to be under control of the companies, which are most fatal to each class of persons, viz. :—

In the class—

|                          |                                                    |                                             |     |     |
|--------------------------|----------------------------------------------------|---------------------------------------------|-----|-----|
| Engine Drivers . . . . . | Running off line . . . . .                         | = 54·3 per cent. of the whole of the above. |     |     |
| Stokers . . . . .        | Collisions, Off line, and Crushed are equal = 33·3 | ...                                         | ... |     |
| Guards . . . . .         | Crushed. . . . .                                   | = 51·9                                      | ... | ... |
| Porters . . . . .        | Do. . . . .                                        | = 89·1                                      | ... | ... |
| Other Servants . . . . . | Do. . . . .                                        | = 74·2                                      | ... | ... |
| Total Employés . . . . . | Do. . . . .                                        | = 58·6                                      | ... | ... |
| Passengers . . . . .     | Collisions . . . . .                               | = 58·7                                      | ... | ... |

Of the accidents under control of the companies, it is remarkable how great a proportion of the deaths among employés comes under the denomination "crushed," particularly amongst porters and other servants. Even in the whole group of employés the ratio from this cause is as high as 58·61 per cent., while amongst passengers it is no more than 4·59 per cent.; and, therefore, by keeping these facts in view, there can be no difficulty in understanding the great discrepancy between the ratio of killed and injured among employés and passengers.

Having said this much in regard to the way in which different classes of persons are affected by different kinds of accidents, we shall now return to the subject of Table XXXVII. The following is a condensed Abstract of it, and will afford a ready means of judging how far fatal accidents from collisions have decreased in recent years.

## ABSTRACT Z.

*Ratio of Fatal Accidents from Collisions at different periods amongst Railway Employés.*

| Period. | Engine Drivers, Stokers, and Guards. |                 |        |             |        | Porters and other Servants. |                 |        |             |        |
|---------|--------------------------------------|-----------------|--------|-------------|--------|-----------------------------|-----------------|--------|-------------|--------|
|         | Number Exposed to Risk.              | Not at Station. |        | At Station. |        | Number Exposed to Risk.     | Not at Station. |        | At Station. |        |
|         |                                      | Killed.         | One in | Killed.     | One in |                             | Killed.         | One in | Killed.     | One in |
| 1844-47 | 10,852                               | 8               | 1,356  | 5           | 2,170  | 96,548                      | 2               | 48,274 | 3           | 32,183 |
| 1848-51 | 23,454                               | 6               | 3,909  | 6           | 3,909  | 209,000                     | 4               | 52,250 | 8           | 26,125 |
| 1852    | 7,252                                | 2               | 3,626  | 4           | 1,813  | 64,619                      | 5               | 12,924 | 1           | 64,619 |
| 1844-52 | 41,558                               | 16              | 2,597  | 15          | 2,770  | 370,167                     | 11              | 33,651 | 12          | 30,847 |

It is hence obvious that so far as the first group of servants are concerned, the danger of fatal accidents from collisions of both kinds has greatly decreased in recent years, but in regard to collisions at stations such has not been the case amongst the other group of railway servants, namely, "porters and other servants."

The next part of this question to which attention is directed is similar to that contained in Abstract M of the preceding paper, which shewed the accidents which had happened to passengers from collisions with trains of different kinds. At page 270 it will be found that throughout the whole period of nine years, 1844-52, but one death of a passenger took place from collisions of "express" trains, and also only one from collisions of "excursion," while none happened from collisions of mail trains, the "ordinary" trains being most fatal to passengers; so also will the same thing be found with regard to *employés*. The following condensed Abstract from Table XXV gives a general view of the results arrived at.

## ABSTRACT Aa.

*Ratio of Deaths and Injuries amongst Employés to the Number of Collisions during 1844-52.*

| TRAINS.             | Collisions.  |          | Employés. |          | Ratio of Deaths and Injuries to |          |                     |          |
|---------------------|--------------|----------|-----------|----------|---------------------------------|----------|---------------------|----------|
|                     | Non-Serious. | Serious. | Killed.   | Injured. | All Collisions.                 |          | Serious Collisions. |          |
|                     |              |          |           |          | Killed.                         | Injured. | Killed.             | Injured. |
| Express . . . . .   | 3            | 8        | 2         | 11       | ·182                            | 1·000    | ·250                | 1·375    |
| Excursion . . . . . | 1            | 7        | ...       | ...      | ...                             | ...      | ...                 | ...      |
| Mail . . . . .      | 8            | 13       | 4         | 8        | ·190                            | ·381     | ·308                | ·615     |
| Ordinary . . . . .  | 42           | 173      | 22        | 57       | ·102                            | ·265     | ·127                | ·329     |
| Total . . . . .     | 54           | 201      | 28        | 76       | ·110                            | ·298     | ·139                | ·378     |

Although the "ordinary" trains have had the greatest number of collisions, and have

also suffered most from this class of accidents, yet when a collision of either an "express" or a "mail" train has taken place, it has proved more fatal to employés than a collision of an "ordinary train;" but on referring to Abstract M the reverse will be found to have been the case in regard to passengers, the collisions of "ordinary" trains being not only more frequent but also more severe and fatal than those of "express," "excursion," and "mail" trains.

In regard to the tendency which accidents from collisions have had since the year 1844, to occasion a greater or a less ratio of non-fatal injuries amongst employés, it will be seen from the following Abstract that in the classes "Engine Drivers" and "Guards" there has been a marked and most decided decrease, varying, amongst engine-drivers, from one in 366 to one in 805 per annum, and amongst guards from one in 566 to one in 1,135. In the class "Stokers," however, which appears much more liable to accidents of this kind than the other two classes, it will be observed that during the period 1848-51 the ratio of injuries was less than in either the preceding or subsequent period, but still, while the ratio was as high as one in 292 in the first period, it became reduced to one in 507 in 1852.

## ABSTRACT Ab.

*The Number and Ratio of Injuries from Collisions happening at Stations, and from Collisions not at Stations, during the Years 1844-52, among*

| Period.             | Engine Drivers. |          |        | Stokers. |          |        | Guards. |          |        |
|---------------------|-----------------|----------|--------|----------|----------|--------|---------|----------|--------|
|                     | Number.         | Injured. | One in | Number.  | Injured. | One in | Number. | Injured. | One in |
| 1844 to 1847 . . .  | 3,658           | 10       | 366    | 3,800    | 13       | 292    | 3,394   | 6        | 566    |
| 1848 ... 1851 . . . | 7,910           | 10       | 791    | 8,205    | 8        | 1,026  | 7,339   | 8        | 917    |
| 1852 . . . . .      | 2,416           | 3        | 805    | 2,537    | 5        | 507    | 2,269   | 2        | 1,135  |
| 1844 to 1852 . . .  | 14,014          | 23       | 609    | 14,542   | 26       | 559    | 13,002  | 16       | 813    |

The part of this question which is next to be considered is that of the fatal accidents to employés from trains "running off the line." According to Abstracts R and X this cause of accidents has been more fatal to engine-drivers, stokers, and guards, than collisions; but it has been otherwise to the other railway servants and to passengers. It will also be observed that of 45 deaths amongst employés from trains running off the line, no less than 38 are recorded as happening to engine-drivers, stokers, and guards; and this is only what might be expected, as they are more than any other of the employés exposed to this kind of accidents, while porters and other servants are more liable to death and injury from being crushed, as shewn in Abstracts X and Z. The following Table shews the deaths and injuries resulting from trains running off the line, since the year 1844:—

TABLE XXXVIII.

*The Number and Ratio of Deaths and Injuries from Trains running "Off the Line" during the Years 1844-52, among*

| Period.       | Engine Drivers. |           |        | Stokers. |           |        | Guards. |           |        |
|---------------|-----------------|-----------|--------|----------|-----------|--------|---------|-----------|--------|
|               | Number.         | Off Line. |        | Number.  | Off Line. |        | Number. | Off Line. |        |
|               |                 | Killed.   | One in |          | Killed.   | One in |         | Killed.   | One in |
| 1844 to 1847  | 3,658           | 11        | 333    | 3,800    | 4         | 950    | 3,394   | 1         | 3,394  |
| 1848 ... 1851 | 7,910           | 5         | 1,582  | 8,205    | 5         | 1,641  | 7,339   | 2         | 3,670  |
| 1852 . . .    | 2,446           | 3         | 815    | 2,537    | 4         | 634    | 2,269   | 3         | 756    |
| 1844 to 1852  | 14,014          | 19        | 738    | 14,542   | 13        | 1,119  | 13,002  | 6         | 2,167  |

| Period.       | Number. | Injured. | One in | Number. | Injured. | One in | Number. | Injured. | One in |
|---------------|---------|----------|--------|---------|----------|--------|---------|----------|--------|
| 1844 to 1847  | 3,658   | 7        | 523    | 3,800   | 8        | 475    | 3,394   | 6        | 566    |
| 1848 ... 1851 | 7,910   | 9        | 879    | 8,205   | 5        | 1,641  | 7,339   | 2        | 3,670  |
| 1852 . . .    | 2,446   | 5        | 489    | 2,537   | 3        | 846    | 2,269   | 3        | 756    |
| 1844 to 1852  | 14,014  | 21       | 667    | 14,542  | 16       | 909    | 13,002  | 11       | 1,182  |

One of the most startling results appearing in this inquiry will be found in the preceding Table. It will be seen that, whether attention be directed to the number of deaths or to the number of non-fatal injuries, in the year 1852 the ratio for each class was amazingly increased beyond that of the period of years immediately preceding, namely, 1848-51. The very wonderful rate of increase in this class of accidents during the year 1852 is difficult to be understood, and the extraordinary increase in the deaths and injuries of employes is not easily to be accounted for. On referring to Table XXVIII it will be seen that the number of trains or parts of trains which actually ran off the rails in that year, was less than in the preceding period relatively, not only to the extent of railway communication open for traffic, but also to the number of persons employed in the service of the companies; and moreover the deaths and injuries of passengers from trains running off the line during 1852 were greatly below the averages of the years 1848-51. In 1852 not a single passenger was killed from trains running off the line, and not more than 17 were injured,

TABLE XXXIX.

*Shewing the Number of Deaths and Injuries to Railway Employés and to Passengers from Railway Accidents in Great Britain and Ireland, during the period 1st January, 1853, to 31st December, 1856.*

| Number of Accidents . . . . .             | Collisions.       |          |                          |          | Trains getting off the Rails. |          |                          |          | Trains running into Sidings through Points being wrong. |          |                          |          | Axles or Wheels of Engines attached to Trains breaking. |          |                          |          | Couplings breaking. |          |                          |          | Bursting of the Boilers of Engines. |          |                          |          | Running into Station at too high a Speed, &c. |          |                          |          | All Causes. |  |  |  |

| GRAND TOTAL . . . . .                                                                           | 23              | 30       | 42       | 35       | 34                    | 65       | 42       | 23       | 10         | 3        | 13                     | 3        | 10         | 2        | 34           | 16       | 56         | 23       | 60             | 20       | 324     | 220      |

while in the period preceding 1848-51, the number killed from the same cause was 16, and that injured 96, or 4 per annum killed and 24 injured. It will be found impossible to account for this discrepancy between the deaths and injuries of employés and passengers, on the supposition of an undue proportion of the accidents from trains "running off the line" having happened to goods' and other trains not carrying passengers; for by referring to Table XXX it will be seen that not a single case occurred of a goods' train running off the line in the year 1852, and, consequently, no death or injury is recorded from that cause. Of the 14 recorded instances of "running off the line," given in Table XXX it will be seen that

*None* occurred to goods' trains.

*One* only to engines—resulting in no deaths, but injury to one employé :—and

*Thirteen* occurred to } resulting in no death amongst passengers, but injuring 17 of them: while no less than 10  
passenger trains... } employés were killed, and 11 injured.

Results of so curious and anomalous a nature are certainly very striking, and must enlist the sympathies of every inquirer on behalf of the more important classes of the railway employés, who are thus exposed to so frightful a sacrifice of life and limb while engaged in the discharge of their duties. It is to be lamented that some more effectual means than are yet in use have not been taken to avert the recurrence of such distressing and calamitous accidents; and I trust the efforts now made to bring this analysis prominently before the public may not be altogether devoid of some beneficial influence in directing the attention of those in authority to so vitally important a subject.

## STATISTICS OF CRIME.

---

IN the present paper, an analysis is attempted to be made of the state of Crime in England and Wales, from the returns furnished by the Home Office, for the years 1834-54.

The first point to which attention will be directed, is the influence of age in the production of crime, and its importance as an element in all inquiries concerning the amount and progress of crime, in various districts, and during various periods. In fact, every accurate investigation into the state of crime of a county will be found to involve the consideration of so many important elements of its vital statistics, that the one branch of study necessarily includes the other.

It was necessary to calculate the population for those years; and the formula given in pp. 2-3 *ante*, has been employed for that purpose, both in respect to the whole population of England and Wales, and the different counties and districts hereafter referred to.

The correction pointed out in page 2 as necessary in regard to the unenumerated ages of the population, was also applied to the enumeration of ages in the criminal returns for the respective years.

The preceding corrections having been applied to the numbers given in the Reports of the Census Commissioners, and also to the numbers given in the Home Office Returns of criminals, the following Tables I and II have been produced.

In the second column of each Table will be found the corrected population for England and Wales at the respective ages, for each of the years 1842, 1843, and 1844; and in the third column the total population for those years at each term of life; the fourth column  
[represents

TABLE I.

*Criminal Offenders in England and Wales in 1842, 1843, and 1844, with the Ratio of Crime to the Population at the various Terms of Life calculated to the corrected Population for the respective Periods.—Males.*

represents the number of criminal offenders in England and Wales during each of the same three years, and at each term of life; and the fifth column contains the totals for the three years. These lead to the consideration of the sixth column, which shews the ratio per cent. of criminal offenders at each term of life, to the population at the same term of life. An examination of this column will immediately shew its importance and its bearing on Criminal Statistics. The tendency to crime among the male population at various terms of life, will be found in Table I to vary from  $\cdot7702$  per cent. to  $\cdot1694$  per cent.; or, in other words, the tendency to crime at one period of life is more than quadruple that at another. In Table II, similar results will be found for the female population, but with a lower specific and absolute intensity to crime. Over the whole male population of England and Wales, the tendency to crime will be found to be  $\cdot2978$  per cent., but for the female sex it will be found to be  $\cdot0633$  per cent.

One very striking and important feature in Table I is the fact, that more than one-fourth of all the criminal offenders in England and Wales, will be found to be at the quinquennial period of life 20 to 25; and, further, that the number of criminals in the same period exceed those in the succeeding quinquennial period by at least 63 per cent. On a comparison of Tables I and II, it will be found that the tendency to crime in the female population is only 21 per cent. of that in the male population; and if the term of life 20 to 25 be taken, the amount of crime among females will be seen to be only 19 per cent. of that among males; or, in other words, there is five times as much crime in the male population as among an equal number of the female population of the country. Two most important facts thus disclose themselves; first, that the great amount of crime is committed at a given term of life; and second, that while one in every 336 of the male population is yearly guilty of a criminal offence, in the female sex the number is one in every 1581 only.

These facts being established, it will follow that, although in two different districts the tendency to crime in each sex at the respective terms of life may be precisely the same, still, should there be a difference in the distribution of the population over the various periods of life, or a higher proportion of males in the one district than in the other, the usual methods of investigating such questions, in which the element of age is not considered, would lead to the fallacious conclusion, that in the one place there was a greater tendency to crime than in the other. In order more fully to establish this point, the following Tables, III and IV, have been prepared, containing the male and female population in England and Wales, for the respective terms of life recognised in the Home Office Returns for criminal offenders. These numbers are collected and arranged from the census returns for 1841; and in Table V the same facts in relation to the male sex will be found set forth in a different form, with an additional column, representing the ratio per cent. of the population at each term of life to the whole population of the male sex in every county.

TABLE III.

*Population.—England and Wales.—1841.—Males.*

The peculiar results arising out of the three preceding Tables, and the influence which a difference in the distribution of the population according to age has in altering the apparent ratio of crime to the population, when the element of age does not enter into the inquiry, will at once become evident. In Tables I and II it was shewn that the tendency to crime at some periods of life was more than quadruple that at other periods; and by Table V it appears, that the ratio of the population alive at the respective periods differs widely in the several counties. In Anglesea, Carmarthen, and Dorset, the proportion of the population alive at the quinquennial term of life 20 to 25, is under 8 per cent. of the whole; but in the counties of Lancaster, Middlesex, and Monmouth, the proportion varies [from 10 per cent.

TABLE VI.

*Criminal Offenders in each County of England and Wales during 1842, 1843, and 1844.—Males.*

from 10 per cent. to upwards of 11 per cent. It hence follows, that if even the tendency to crime were precisely the same at the respective terms of life in those districts, there would still be, in reference to the whole population, an apparent excess of crime in the three latter counties, from the fact that they contain a greater proportion of their population at that term of life at which the tendency to crime is the greatest; and, consequently, any method of investigating crime in which the element of age is not introduced, can never shew the relative amount of crime in different districts, nor in the same district at different periods of time.

Still further to establish this truth, Table VII has been constructed on the hypothesis, that in the various counties and districts the tendency to crime was the same as prevailed in England and Wales during the years 1842, 1843, and 1844, as represented in Table I. The actual populations of those places were taken as given in Table III. In Table I it will be seen that the actual proportion of male criminals in England and Wales during those three years was one in every 336 of the whole male population. If the population of the kingdom, however, during those years, had been under the same distribution in regard to age as in the year 1821, the proportion of criminals would have been one in every 365 only of the population; but, on the other hand, if under the same distribution as the city of Glasgow, crime would appear to have been as high as one in every 304. Again, the difference of distribution of even two districts in the metropolis is such as to produce in Bethnal Green the proportion of one in 338, while in St. George's, Hanover Square, the ratio would be as high as one in 280; shewing a difference or error in the method of inquiry thus resorted to, of about 21 per cent. An inspection of the results for the several counties will furnish evidence of similar irregularities. In Anglesea, Cardigan, Carmarthen, Dorset, Merioneth, Montgomery, and Pembroke, the ratio of crime is one in 360 and upwards; but in Glamorgan, Lancaster, Middlesex, and Monmouth, the average is from one in 325 to one in 313, being a difference of at least 18 per cent. It is therefore evident that the element of age is an essential item in every inquiry or investigation into the relative amount and progress of crime in different districts, and that calculations in which that element is neglected cannot be relied on; for we have here examples of districts in which the same ratio of crime is assumed to prevail, and yet there would appear to be an excess of crime in some places of 20 per cent. above that which would seem to prevail in others.

The arguments and illustrations now brought forward to shew the necessity of viewing age as an element in all inquiries into the prevalence of crime, it will be seen, apply with equal force to the question of sex.

Over the whole male population of the country, the tendency to crime is nearly five times as great as in the female sex; and since in some districts of the country the proportion of the population of the two sexes at the various periods of life is very different, the results of any inquiry in which the sexes are not distinguished must be subject to very great fallacies, shewing errors to a greater extent than even those connected with the element of age, as that element would equally affect the present case, and be further vitiated by the disturbing influence of sex. It is therefore obvious, that in every properly conducted inquiry in criminal statistics, a separate analysis must be made for each sex.

Some very curious and interesting features will be found to connect themselves with Tables I and II, and also Tables XXII and XXIII. From the age of 20 it will be found that in the male sex, crime, in each successive term of life given in the Tables, decreases

at the rate of 33·333 per cent., and in the female sex, at the rate of 25 per cent. ; so that if two Tables were formed, in one of which the numbers resulting from such a law were given, and in the other the actual number of criminals, the one Table, particularly in reference to the female sex, would be almost identical with the other. The following Abstract will shew the ratio of criminals according to the actual results for England and Wales during the years 1842-4, and also during the years 1845-8, as well as according to the theoretical law just alluded to ; and in regard to the years 1842-4, it will be seen that in only one of the terms of the male sex is there any material difference between the two classes of results, while for the female sex, the actual and the theoretical results are almost identical throughout the whole of the Table.

In statistical inquiries the discovery of any such law as that now pointed out is of the first importance, for it gives evidence of the existence of some very powerful and intense element connected with the determination of the particular class of results, and but little influenced or disturbed by external circumstances ; which, if once clearly exhibited, may admit of such modifications in its conditions as will lead to practical and highly beneficial modes of administration, tending to elevate the moral and political condition of the people. It is only from a properly determined series of results, developing general principles in the truth and safety of which confidence can be placed, that any effective legislation can result ; and without the appearance of some numerical laws, those principles themselves must remain comparatively obscure, and legislation continue impeded. It will be found that this theoretical law is not peculiar to the periods of years to which the preceding facts relate, but is a proper and distinctive feature in the conditions of society under which crime appears in other years. The preceding Abstract has relation to the years 1842-8 only, because prior to the year 1842, the Criminal Returns published by the Home Office gave the ages of criminals for a division of ages which could not be assimilated with the periods of life recognised in the census ; and to have introduced them would only have lessened the value of the facts now presented ; but from the following Abstract it will be seen, that so far as the Criminal Returns for the four years 1838-1841 go, traces of the same law of crime are clearly observable.

It must thus appear evident that whatever means may be employed for the prevention of crime, or the treatment of criminals, ought to shew their influence and bearing on the male sex chiefly between the ages of 20 and 25. The following Abstract from Tables I and II and XXII and XXIII will shew the relative tendency to crime in the two sexes at the various terms of life.

| Age.         | Ratio per cent. of Criminals to the Population, yearly. |         |          |         | Number of the Population to which there is one crime yearly. |         |          |         | Excess per cent. of Crime among Males. |         |

It will be observed that in the male sex the tendency to crime at ages 15-20 is somewhat less than in the next quinquennial period of life; but a similar result does not appear for the female sex during the period 1842-4, as the tendency to crime at those two periods of life is nearly equal. In the Home Office Returns the ages of the offenders under 15 years is not distinguished; but if the age of criminals under 15 be held to be between the ages of 10-15, it will alter the expressions at that term of life in Tables I and II, and in the corresponding columns of the above Abstract from ·0494 per cent. to ·1607 per cent. for the male sex, and from ·0080 per cent. to ·0266 per cent. for the female sex, and a similar modification will be necessary in respect to the results derived from Tables XXII and XXIII.

In Table VI preceding is given the number of criminal offenders in each county of England and Wales, at the respective terms of life recognised in the Home Office Returns, for each of the years 1842, 1843, and 1844; also the total number of criminals in the various counties, at each term of life for the three years, as well as the average number for the three years.

The next Table to which attention is directed (Table VIII) is one of some importance, as it shews the actual yearly average number of criminals in each county of England and Wales, during the years 1842, 1843, and 1844, and for every term of life. In a parallel column is given what would have been the number of criminals at the same terms of life, provided the same tendency to crime had prevailed in each county as over the whole kingdom. A comparison of the parallel columns will at once shew, whether the actual crime in any county be above or below the average of the whole kingdom, and also at what term of life the increase or decrease of crime prevails. A further analysis of the same facts will be found in Table XI, in which a correction is applied for the increase of population to the mean times of the years 1842, 1843, and 1844; and in the last column of that Table will be found the difference per cent. between the actual amount of crime in each county, and that which would have resulted if the same tendency to crime had prevailed as over the whole of England and Wales.

Having thus found the actual amount of crime in each county, in relation to the ages of the population, as well as the average crime in each county at the same ages, according to the ratio for the whole kingdom, and observed the marked differences in the amount of crime in various districts,—some having an excess of crime of more than 52 per cent. above the average of the country, while other districts are below the average by at least 80 per cent.;—it becomes an important problem for solution, to discover, if possible, the nature and character of that element in the condition of the respective districts which produces so remarkable a disparity, and exercises so powerful an influence in the development of crime.

Various methods suggest themselves of effecting such an analysis as might possibly lead to the discovery of any agent, so materially influencing the moral and social state of society. The first arrangement adopted is that supposed to connect itself with the manufacturing or agricultural interest of a district. In Table IX the manufacturing and mining counties are divided into four groups,—the northern mining districts; the cotton and woollen manufacturing districts; the cotton, woollen, silk, and lace-fabric districts; and the hardware, pottery, and glass manufacturing districts. Again, the agricultural counties will be found to be divided into three groups,—the North-Eastern and Eastern, the Midland, and the South and South-Western districts. In each of these combinations the actual number of criminals at the respective periods of life is shewn, as well as the number that would result in those districts at the same ages, if the same tendency to crime prevailed as over the whole of the kingdom.

In Table XII the same facts will be found under a more convenient arrangement.

[The first

TABLE VIII.

*Shewing the actual amount of Crime in each County, according to the average of the years 1842, 1843, and 1844; and also the calculated amount supposing the ratio to be the same as that for the whole of England and Wales during the same years.—Males.*

The first column of each group shews the amount of crime at each period of life, assuming the intensity to be the same as over the whole country, and also that the population of each group was the same as at the period of the census in 1841. Under the total of these results will be found the corrected total, making allowance for the increase of population during the years 1842, 1843, and 1844. These corrections were taken from Table XI, and in the early part of this paper the formula for the correction is given. In the next column of each group will be found the actual number of criminals at the same ages, and in the third column is set forth the difference per cent. between the calculated and actual amount of crime. The results of this column are of the utmost importance, as they shew not only whether the total amount of crime in a given district is above or below the average for the whole kingdom, but they also point out what are the periods of life at which the most marked and important differences exist, thus leading the way to more definite and accurate views on criminal jurisprudence.

If the whole group of the Great Northern and Midland mining and manufacturing districts be taken, it will be seen that there is exactly 2·3 per cent. less crime than would be according to the average for all England and Wales, while in the agricultural counties there is an excess of 5·9 per cent. Again, if the various groups of the manufacturing and mining districts be examined, it will be found that in the northern mining district, which includes Cumberland, Northumberland, and Durham, crime is 52·1 per cent. below the average; and in the cotton and woollen manufacturing district, which includes Lancashire and Yorkshire, crime is 7·0 per cent. under the average of the whole country; but, on the other hand, in the two remaining districts, the one composing the cotton, woollen, silk, and lace-fabric district, including Chester, Derby, Nottingham, and Leicester—and the other composing the hardware, pottery, and glass manufacturing district, including Staffordshire, Warwick, and Worcester—there is an increase of crime, the former being 8·5 per cent. and the latter 33·5 per cent. above the average for the whole kingdom. Contrasting the various sections of the agricultural group with them, they will be seen to present a remarkable uniformity; the excess of crime in the first division being 5·3 per cent., in the second 5·7 per cent., and in the third 6·8 per cent., while the excess for the whole of the agricultural districts combined has been shewn to be 5·9 per cent.

It is, therefore, evident that there is something in the mining and manufacturing condition of the people, having a powerful influence in stimulating the amount of crime, as in one portion there is an excess of 33·5 per cent., while in another, crime is 52·1 per cent. below the average; and although the whole combined shews a less degree of crime than the average of the whole agricultural districts, and also less than the average of all England and Wales, still the remarkable disparity existing between particular manufacturing groups bears evidence that there must be some peculiar element operating in the social and moral state of the people, which it is highly important to understand.

[Before,

Before, however, entering further into that part of the subject, it may be better to refer to another feature of importance in Table XII, for the first time exhibiting anything like a clear view of the question.

It has been usual of late to refer to juvenile delinquency as an explanation of the increase of crime in many districts; in fact, so powerfully has this been felt in some quarters, that the most strenuous efforts have been made, with a view of reducing the cases on the criminal calendar; and yet it will be seen that the facts of the case do not support the supposition, that either the increase or decrease of crime in particular districts is materially, if at all, affected by fluctuations in juvenile crime. This will appear most evident by an inspection of any one of the nine groups, or combinations, given in Table XII. If the general result for any one, or all of them, whether in connection with an increase or decrease of crime, be compared with the corresponding features at the juvenile ages, there will not be found a single instance, in which the character of the general result is so strongly confirmed by the facts at the younger ages, as by those at the more advanced periods of life. Should any change or movement be found in the criminal returns of any particular district, that change will be discovered to be promoted, not so much by fluctuations at the terms of life 10-15 or 15-20, as by the increase or decrease among those persons of more advanced ages. The general total for the mining and manufacturing districts shews a difference of + .4 per cent., but at the juvenile ages under 15 and 15-20, the differences are -1.9 per cent. and -7.6 per cent. respectively, so that while the gross results are positive, those at the younger ages are negative. Again, the general total for the agricultural districts is + 9.1 per cent., but the result for under 15 is - 12.3 per cent., and for 15-20 only + 3.2 per cent. Relations precisely similar will be found in each of the other groups, thus leading to the conclusion that, in the juvenile period of life, the tendency to crime is within the influence of more constant laws or elements, and therefore shews less fluctuation than in mature life, when the conduct and disposition of individuals come more under the control of external circumstances.

In such groups of counties and districts as those given in Table XII, it is evidently of the first importance, that the manufacturing or agricultural character of the districts should, in reality, be a decided and prevailing feature, otherwise their supposed relation and influence on crime can never be determined. There are no counties or great districts of the kingdom, in which either agriculture or manufactures prevail to the entire exclusion of other interests; but still there are many districts in which either agriculture or manufactures form so decided a feature, that if the moral and social conditions thence arising have any influence on the amount of crime, the evidence of that supposed influence must be observable. In England and Wales, at the period of the last census, the average ratio of agriculturists to the whole population was 7.9 per cent.; and the first group of the following Table XIV contains the results for the ten counties in which there was found to be the least proportion of agriculturists; and the second group of the same Table contains the results for the eleven counties in which the highest ratio of agricul-

tourists was found. It will be seen that the ratio of agriculturists for each county is set forth in the second column; in the third is given the average annual ratio of crime for the whole kingdom; and in the fourth, the actual crime in the given county. These results are taken from Table XI; and a comparison of the total of the two last columns will shew whether the crime in each group or section is above or below the average for the whole kingdom. If, then, the greater or less proportion of agriculturists in a community has any material influence on the degree of crime, it might reasonably be looked for in the results of those two sections; but it will be found that in the group of least agriculturists there is an excess of 6·0 per cent. of crime above the average of England and Wales, and by excluding the county of Lancaster, which is of sufficient magnitude to form a group of itself, the excess will still be 4·6 per cent. Compare this with the results for the section containing the highest average of agriculturists, and the excess of crime will in that also be found to be exactly 4·6 per cent; and so far, therefore, as a maximum or a minimum ratio of agriculturists in a community is concerned, there seems to be little or no difference in the amount of crime. On reflection, it will appear that a high ratio of agriculturists in any district does not necessarily imply a low ratio of manufacturers, and *vice versa*, as both interests may co-exist in maximum or minimum in any district; another combination was therefore adopted, in order to determine the influence of manufactures.

In England and Wales the average ratio of manufacturers to the whole population is 16·5 per cent.; and in the third group of Table XIV will be found the results for the eight counties in which there is the highest ratio of manufacturers. It thence appears that the actual crime exceeds the average of the whole country by 18·2 per cent., and, exclusive of Lancashire and Middlesex, by 17·7 per cent.; but in the fourth group of the same Table, which is composed of the counties having the least average of manufacturers, the actual crime is under the average by 2·9 per cent.

It is evident that the preceding combinations are liable to the objection, that the influence of the high or low ratio of agriculturists may be neutralised by a corresponding high or low ratio of manufacturers; and hence the preceding curious results. To meet this objection, Groups Fifth and Sixth have been formed.

It has already been stated, that the ratio of agriculturists to manufacturers in England and Wales is 7·9 per cent. to 16·5 per cent.; difference, 8·6 per cent. In order to obtain a group of counties in which the manufacturing interests formed a proper and decidedly prevailing feature, Group 5 has been formed of those counties only in which the manufacturing interest exceeds the agricultural interest by at least 33·33 per cent. more than the above difference for the whole kingdom; and the result arrived at is, that the actual crime exceeds the average of the country by 15·0 per cent.; and excluding the counties of Lancaster and Middlesex, the excess is 10·8 per cent. Again, in the sixth group of Table XIV the results of those counties are given, in which the agriculturists are above the average ratio by at least 50 per cent.; and therefore those two last groups

[must exhibit

TABLE XIII.—MALES.

*Difference between the Actual Amount of Crime in each District and the Average for England and Wales.*

must exhibit the most striking contrast between each other in respect to their manufacturing and agricultural populations. If then the predominance of either the one or the other interest has any influence on the amount of crime, it should manifest itself in the results of these two groups; but it will appear that the actual crime in the last of these groups also exceeds the average of the whole kingdom; the excess being 4·2 per cent.; and although this difference falls somewhat short of the other, it is not of so marked a nature as to demand further investigation.

Carrying out the same mode of classification, Group 7 has been formed of the seven counties in England and Wales, in which the manufacturing and agricultural interests were as nearly as possible equal, in no instance differing by more than ·6 per cent.; and it is somewhat remarkable to find that in this case the excess of crime is 4·5 per cent., differing from the result in the preceding group by only ·3 per cent. It is therefore evident that the mere fact of the difference in the habits and condition of agriculturists and manufacturers can have very little to do with the increase or decrease of crime, and that some other solution of the very great disparity found to prevail between particular districts must be sought for. The following Abstract shews the difference per cent. between the actual amount of crime in each of the districts or groups of Table XIV, and the average for the whole of England and Wales:—

## MALES.

| 2. Highest Ratio of Ditto . . . . .                            | 3009·05        | 3045    | 3150          | 3338    | + 4·6                | + 9·6   |
| 3. Highest Ratio of Manufacturers . . . . .                    | 3053·01        | 2828    | 3593          | 3915    | + 17·7               | + 38·4  |
| 4. Lowest Ratio of Ditto . . . . .                             | 2001·25        | 1772    | 1941          | 1782    | — 2·9                | + ·6    |
| 5. Manufacturers, 33 $\frac{1}{3}$ per cent. above the average | 3897·17        | 3621    | 4321          | 3779    | + 10·8               | + 4·4   |
| 6. Agriculturists, 50 per cent. above the average .            | 3411·13        | 3024    | 3555          | 3257    | + 4·2                | + 7·7   |
| 7. Agriculturists and Manufacturers nearly equal .             | 2348·68        | 2086    | 2456          | 2198    | + 4·5                | + 5·4   |
| 8. Greatest Wealth . . . . .                                   | 2527·31        | 2261    | 2303          | 2300    | — 8·8                | + 1·7   |
| 9. Least Wealth . . . . .                                      | 2541·67        | 2334    | 2512          | 2136    | — 1·1                | — 8·5   |

The preceding combinations so far as relates to the period 1842—4 have shewn that in the least as well as in the most agricultural districts the excess of crime was precisely equal, namely, 4·6 per cent. It was likewise seen that in the districts in which there is the highest average of manufacturers, as well as that in which there is the highest average of agriculturists, and also that in which the two interests are equal, the tendency to crime differs very little. It may therefore be safely concluded that neither of them gives any clue to work out the problem—What is the element or feature in the condition of life and social state of society which produces in one great community an excess of crime amounting to 52·1 per cent. above the average, and in another community reduces crime below the average 33·5 per cent.?

Another argument usually adduced in explanation of the greater or less prevalence  
[of crime,

TABLE XIV.

1842-4.

*Difference between the Actual Amount of Crime in each District, and the Average for England and Wales.—Males.*

## GROUP 1.

In England and Wales the average ratio of Agriculturists to the whole Population is 7·9 per cent. In the following there is the lowest average of Agriculturists.

| COUNTIES.                | Ratio of Agriculturists. | Calculated Average. | Actual Crime. |
|--------------------------|--------------------------|---------------------|---------------|
| Lancaster . . . . .      | 3·0                      | 2574·67             | 2802          |

|                        |        | 2261                | 2300          |

## GROUP 9.

Counties in which the proportion is 33 per cent. less than the average.

| COUNTIES.             | Ratio. | Calculated Average. | Actual Crime. |
|-----------------------|--------|---------------------|---------------|
| Bedford . . . . .     | 1·6    | 134                 | 159           |
| Stafford . . . . .    | 1·6    | 754                 | 719           |
| Derby . . . . .       | 1·9    | 364                 | 199           |
| Monmouth . . . . .    | 1·9    | 234                 | 193           |
| Northampton . . . . . | 1·9    | 263                 | 236           |
| Nottingham . . . . .  | 1·9    | 318                 | 267           |
| Bucks . . . . .       | 2·0    | 192                 | 289           |
| Hunts . . . . .       | 2·0    | 75                  | 74            |
|                       |        | 2334                | 2136          |

of crime, is the comparative wealth or poverty of particular districts. No very exact means exist by which to determine in what districts or counties there is the highest or least proportion of wealth; but so far as means are available, an attempt has been made to test the value of the argument advanced.

In England and Wales, according to the census returns, the average ratio of persons of independent means is 2·8 per cent.; and by taking those counties as given in Group 8, in which the proportion is exceeded by at least 33 per cent., it will be found that the actual crime is below the average of the whole kingdom by 8·8 per cent.; but in connection with this, it is curious to observe the results of Group 9, which is made up of those counties in which the proportion of persons of independent means is 33 per cent. below the general average, for in that case also crime is below the average of the whole country, although to the extent of 1·1 per cent. only. No powerful or active element can therefore be traced in connection with this feature, sufficient to account for some of the widely different results already observed.

The preceding remarks have been made in respect to the results appearing in the sixth column of the Abstract given in page 346, and derived from Table XIV, but if attention be directed to column seven of the same Abstract, derived from Table XV, representing the results for the period 1845-8, it will be found that the same reasoning, with very slight modifications, will apply to nearly all the combinations.

In this country no satisfactory test can at this time be employed in order to discover those districts in which the people generally receive a greater or less degree of instruction. The Educational Returns, made in connection with the Census of 1851, as they relate to the younger portion of the population only, are not applicable: and perhaps the very best available test is that furnished by the returns of the Registrar-General. Under the New Marriage Act, every person married must sign the Marriage Register; and an abstract has been made for each county, shewing the number of persons signing the Register with their names, and the number signing with their marks; so that if the mere mechanical qualification of an individual being able to sign his name be regarded as evidence of the relative degree of education which he has received, it becomes possible to classify the several counties in England and Wales according to the degree of the education of its population. This test is of the more value because at that period of life at which the greatest amount of crime takes place, there is also the greatest number of marriages; and, consequently, both classes of facts will have a more immediate and direct relation to each other.

If the term education were held to signify the culture and elevation of the moral character, it is evident that its immediate and essential influence would be to destroy crime: in fact in this sense, education and freedom from crime must bear the relation to each other of cause and effect; and therefore when education is at a maximum, crime must of necessity be at a minimum; so that if the term be thus explained, statistical evidence would be *à priori* unnecessary to solve the problem proposed: but if the term education be used in its ordinary

acceptation, merely to imply instruction, it then becomes a fit and important question, whether education in this limited sense has any influence on the development of crime.

The proportion of the male population in England and Wales signing their marriage certificates with marks is 33 per cent. The first group in the following Table XVI is made up of those counties in which the proportion signing with marks exceeded the general average by at least 33·33 per cent., and may be called the counties of lowest degree of education. The second group in the same Table is composed of those counties in which the proportion is at least 25 per cent. under the average, and may be termed the group of highest degree of education. On comparing the results of these two groups, it is found that, during the period 1842-4, where there is the lowest degree of education, there is an excess of crime of 13·2 per cent.; but in the group of the highest degree of education the actual crime is 30·7 per cent. under the average of the whole kingdom, and during the years 1845-8, the corresponding results derived from Table XVII are an excess of crime of 14·6 per cent. in the group of lowest degree of education, but in the group of highest education crime is 21·0 per cent. below the average ratio for the kingdom. To this extent the influence of education is evident.

TABLE XVI.

1842-4.

In England and Wales 33 per cent. (Males) signed the Marriage Register by their *Marks*. In the following Counties the highest proportion did so, being all at least 33½ per cent. above the average.

## GROUP 1.

| COUNTIES.           | Ratio signing with their Marks. | Calculated Average. | Actual Crime. |
|---------------------|---------------------------------|---------------------|---------------|
| Hertford . . . . .  | 50                              | 229·57              | 258           |
| Monmouth . . . . .  | 51                              | 231·62              | 201           |

## GROUP 2.

Counties in which the lowest proportion signed with their *Marks*, being all at least 25 per cent. below the average.

| COUNTIES.                | Ratio signing with their Marks. | Calculated Average. | Actual Crime. |
|--------------------------|---------------------------------|---------------------|---------------|
| Bucks . . . . .          | 14                              | 192                 | 289           |
| Cumberland . . . . .     | 16                              | 222                 | 90            |
| Surrey . . . . .         | 17                              | 793                 | 864           |
| Northumberland . . . . . | 18                              | 336                 | 139           |
| Westmoreland . . . . .   | 20                              | 55                  | 43            |
| Devon . . . . .          | 28                              | 643                 | 520           |
| Durham . . . . .         | 26                              | 479                 | 203           |
|                          |                                 | 2720                | 2148          |

But it may be held, that in the two groups now referred to, the difference in the amount of crime may be owing to the influence of some other element than simply education. So far as the subject is yet interrogated, it may be fairly said, that a high state of education is always found accompanied with a reduced rate of crime, and that a low state of education carries with it an increased amount of crime; but it still remains to be determined whether that difference may not arise through the agency of some other element. It may be argued that a high state of education is generally the concomitant of wealth, or a more advanced position in the social scale of society, and hence the reduced rate of crime; and that a low state of education is usually associated with a peculiar grade of employments and manufactures, subject to marked fluctuations in prosperity, exposing those engaged in them to deprivation, temptation, and vice, and thus directly increasing the amount of crime: a result which is falsely believed to have arisen from

want of education, instead of the poverty and distress co-existing with it. To try the strength of this objection, a still further analysis of the facts presented will be necessary.

If it were possible to arrange the several counties or districts in sections, so that when any two sections were compared, the communities composing them were as similarly as possible circumstanced in regard to manufactures, in regard to agriculture, in regard to wealth—in fact that the two differed from each other only in the degree of instruction or education—it might then be said, at least so far as statistical tests are at present available, that the two sections or classes compared were, with the exception of education, placed under exactly the same social and political conditions of society; and should the ratio of crime prevailing in those two districts differ from each other, the difference must of necessity arise from the difference existing in their degrees of education.

On referring to Table XVIII it will be seen that each group is composed of the same counties which formed the various classes or combinations in Table XIII; but it will be further seen that each of these groups is divided into two sections; the right-hand section of which—Section (*b*), will be found to contain those counties in which there is the highest degree of education—and the left-hand section, or Section (*a*), those counties with the least degree of education; and as the counties in each differ in respect of education only, the difference, if any, in the results of the respective sections of these groups will furnish the argument for or against the influence which education may have on the amount of crime.

In Group 1, Table XVIII, being the class of “least agricultural” counties, it will be found that in the section of least education there is an excess of 16·6 per cent. of crime; and excluding Lancashire, the excess of crime above the average of the country will be 25·8 per cent.; but in the section of most education the actual crime will be found under the average, at least 12·8 per cent. Again, in the group of “greatest agricultural” counties, there is an excess of 8·4 per cent. in the section of least education, and in the section of most education the excess of crime is only ·9 per cent.

In the third group, representing the “greatest manufacturing” counties, where there is least education, the excess of crime is 24·8 per cent., and excluding Lancashire, the excess is 48·4 per cent.; but in the section of highest education the excess is 24·2 per cent., and excluding Middlesex, the excess of crime is not more than 16·4 per cent. In the next group in order, that consisting of the “least manufacturing” counties, there is an excess of 4·3 with least education; and crime is 8·7 below the average where a higher degree of education prevails.

On referring, however, to Groups 5 and 6 of Table XVIII, more decidedly manufacturing and agricultural counties will be found, and in them very striking evidence of the influence of education will appear. In the manufacturing group it will be seen that in the section of least education crime is above the average 15·8 per cent.; but in the section of most education crime is below the average 7·2 per cent., and in the section  
[of least education

|                           |                           | 1197                | 1145          |                           |                           | 1137                | 991           |

of least education, if Lancaster be excluded, the excess of crime will be 23·2 per cent. Again, in the decidedly agricultural counties, with the lowest grade of education crime is in excess 10·4 per cent. ; but with the higher scale of education, there is less crime than the average of the country by 2·6 per cent. In the 7th group of the same Table, containing the counties in which the manufacturing and agricultural interests are nearly equal, it will be found to bear similar evidence to the influence of education on crime. For with the inferior degree of education there is an excess of crime of 15·8 per cent. ; but with the comparatively higher degree of instruction, crime is 9·3 per cent. below the average.

The 8th and 9th groups in Table XVIII furnish a still more remarkable proof of the same principle. On referring to Table XII, it will be found that crime in both of these groups was below the average of the whole kingdom ; but here, when sub-divided according to the means of education, it is found in the group of greatest wealth that the section of least education shews an excess of crime amounting to 9·2 per cent., and that the section of most education is 29·4 per cent. below the average in crime. The results for the group of least wealth go to establish the same fact ; there being an excess of 11·3 per cent. with the least degree of education, and with the best education a less amount of crime than the average by 13·5 per cent.

It is thus found that in every instance an increase of crime is associated with a low state of education ; but where a better state of education prevails, there is as constantly found to be a less amount of crime. The following Abstracts will give a condensed view of the results obtained from Table XVIII.

| Least Wealth . . . . .                                         | 1261·04                       | 1197    | 1405          | 1145    | 1280·63                     | 1137    | 1107          | 991     |
| Total . . . . .                                                | 14343·38                      | 13015   | 17130         | 13959   | 13382·77                    | 12151   | 12380         | 11697   |

An examination of the preceding figures cannot fail to render manifest the powerful influence which even the simple qualification of individuals being able to sign their names, has on the amount of crime in the various districts of the country. Contrasting the totals for the various sections of each group of counties, it will be seen that, in the section of inferior education, the excess of crime is 19·4 per cent., while in the section of higher education there is 7·5 per cent. less crime than the average of the kingdom.

In the next Abstract, the difference per cent. between the actual crime in each of the preceding groups, and the average rate for the whole of England and Wales, is given. When the amount of crime is above the average, the result will be distinguished by the sign +, and that the actual crime is below the average, will be expressed by the sign —.

The last column of the preceding Abstract shews the difference per cent. in the rate of crime in the badly-educated sections of each group, over that which prevails in the better-educated sections of the same group: and it must be regarded as a powerful argument in favour of even the small degree of education or instruction here recognised, that not a single instance has appeared in which a marked, and generally a most striking difference, averaging above 25 per cent., does not shew itself in favour of the better educated districts. All the other combinations and arrangements made to determine the active element in the increase and decrease of crime were unsuccessful, and produced no [satisfactory result;

TABLE XX.  
*Counties in which the actual Crime exceeds the Average Ratio for England and Wales.—Males.*  
 1842-4.

satisfactory result; in fact, they did not lead to the discovery of any condition or circumstance of life which was peculiar to one district more than another; but, as soon as the educational test is introduced, it immediately analyzes groups and districts into a uniform and regular series, which before shewed the most contradictory results. If a few exceptions appeared, they might suggest the propriety of a still further refinement in the analysis; but the regularity is so remarkable, that it immediately becomes evident that at least one very powerful element in the question has been determined, and one on which legislative and preventive measures may easily be founded, for the reduction of crime and the elevation of the moral condition of the people.

On a careful consideration of the evidence and facts brought forward, it will be seen that, although the peculiarities in the mining, manufacturing, agricultural, and other conditions of the population are not sufficient to account for the great differences in the degree of crime prevailing in various districts, still it is clear, that the results arising out of those peculiar conditions are such as to shew that they exercise a secondary influence on the question of crime, and therefore ought not to be overlooked in any complete investigation.

The preceding Table, XX, was formed in order to shew, that in those districts in which there was an equal difference in the amount of crime from the average of the country, no peculiar element could be traced which was common to all the counties composing each group.

In connection with the results, adduced in the preceding part of this paper, it will be important to view the amount of education among criminals themselves.

*Degree of Education amongst Male Criminals in England and Wales during the four years 1836-9, the three years 1842-4, and the four years 1845-8.*

It is thus curious to observe, that while the proportion of criminals who could neither read nor write was 31.9 per cent., the ratio of persons who signed their marriage register with marks, (that is, were unable to write their names) was 32 per cent.; and it might thence be inferred that, from the small difference in those two ratios, education could have no very important effect in repressing or augmenting the number of criminals; but the number of persons signing their marriage registers with marks should not be taken as the absolute, but only as the relative degree of education in different districts; and it should be borne in mind, that although 32.0 is the average for the whole of England and Wales for the years 1836-48, there are some districts in which the proportion is as low as 12 and 14 per cent., and others in which the ratio is as high as 50 and 51 per cent.; and it has also been already shewn, that no reliance can be placed on the mere gross average results thus given, but that it is imperatively necessary to separate the whole into groups, in which the influences of wealth, manufactures, and agriculture are common—in fact, into groups differing in respect of education only, so as to furnish a proper argument for or against the influence which education may have on the amount of crime.

According to the returns of the Registrar General, the proportion of males signing their marriage registers with marks has gradually decreased from 33.7 per cent. in 1839, to 31.2 per cent. in 1848. It also appears that during the same years the number of criminals unable to read or write has decreased from 33.5 per cent. in the former year to 31.9 per cent. in the latter; from the year 1839 the ratio had gradually fallen to 29.8 per cent. in 1844, and had again pretty uniformly increased to 31.9 per cent. in the year 1848; but it does not follow on this account that education is favourable to crime, for it may happen that increased temptations over the country generally have arisen within that period; and the question would still remain open, whether in the higher educated districts crime was greater or less than in the lower educated districts, all the other conditions of those districts being the same.

Adopting the test furnished by the records of the Registrar General, it is obvious that in those counties in which there is an inferior degree of education, there is also an increased ratio of crime; and that not a small and barely appreciable difference, but in 11 different groups of counties into which the whole of England and Wales is divided, shewing a difference in favour of the best educated districts varying from 13 to 43.9 per cent., and averaging 25 per cent. for the whole of England and Wales. It is thus evident, that so far as the test now furnished is available, more conclusive evidence could not be called for.

[This test, however,

TABLE XXIV.

*Shewing the Degree of Instruction among the Criminals in those Counties where Crime exceeds the Average Ratio of England and Wales.—Males.  
1842-3-4.*

This test, however, being derived from a source partly independent of the criminals themselves, has led to a similar analysis of an educational test to be derived from among the criminal population. The Home Office returns shew for each year the number of criminals *who can neither read nor write—who can read and write imperfectly—who can read and write well—and who have a superior education.*

Attention will first be given to the first two classes of criminals. The various counties of England have been divided into six different groups, in the first two of which the ratio of crime does not differ by 15 per cent. above and below the average for England and Wales. In the next two groups the difference of crime is from 15 to 30 per cent. above and below the average. And in the last two groups the difference is at least 30 per cent. above and below the average respectively. For each of these groups the educational condition of the criminals has been abstracted; the detailed results of which are given in the preceding Table, XXIV, from which the following Abstract is taken:—

| Groups of Counties in which the                       | 1842-4.                                  |                                              |                                       |                        |                                       |                                          |                                              |                                       |                        |                                       |

| Total . . . . .                      | 4.4                                        | 5.6                                            | 4.6                                        | 5.8                                            |

It is thus seen, that in each group in which there is an increased amount of crime, there is invariably an increased ratio of criminals who can neither read nor write. Taking the three parallel groups of counties in which those characterised by crime above the average are compared with those below the average crime, it will be seen that during the period 1842-4 the difference of criminals unable either to read or write is respectively 6·9, 2·2, and 3·1 per cent. greater in the counties having an excess of crime. On the other hand, the proportion who can read and write imperfectly shews a corresponding increase in favour of the groups with a low ratio of crime, being respectively 3·7, and 7·7, and 5·2 per cent. Similar results appear for the period 1845-8.

The following are the results for the total of those counties in which crime is above and below the average respectively for the seven years 1842-8:—

|                                                        | Where Crime is<br>above the average. | Where Crime is<br>below the average. |
|--------------------------------------------------------|--------------------------------------|--------------------------------------|
| The per-centage that can neither read nor write is     | 32·75                                | 28·25                                |
| (Difference 4·5 per cent. in favour of Education.)     |                                      |                                      |
| The per-centage that can read and write imperfectly is | 58·0                                 | 63·7                                 |
| (Difference 5·7 per cent. in favour of Education.)     |                                      |                                      |

Thus far it would seem that the evidence furnished of education, among even the criminals themselves, tends to shew that the small amount of instruction implied in the test here recognised—the simple distinction between the ability to read and write imperfectly, and inability either to read or write at all—has a most material influence in the development of crime; and, were the investigation carried no further, we should be forced to conclude, that since the most criminal districts shew a higher ratio of uneducated persons among the criminals, and the less criminal districts a less proportion who are wholly destitute of the rudest elements of education, the immediate inference is, that even this small degree of instruction tends to the repression of crime.

Unless, however, this analysis were carried beyond its present limits, it may be objected, as in the former paper, that the peculiar results produced may be owing to some other cause than education. It may happen that differences of manufactures, of agriculture, of wealth, or of position in the social scale of society, existing in combination with the degree of crime already noticed, may be the real and active agent in producing the peculiar results attributed to education. In order, therefore, to see how far the facts of the case will support this view, a more refined analysis has been made of the various counties, placing them in groups, as in Table XVIII, in fact, placing them in groups so that they differ from each other only in their educational condition. It will thus be seen that the combinations now presented will exhibit all the methods by which the former analysis on pages 360-2 was brought to bear on the educational state of the whole community. And these have been further reduced to shew in precisely the same groups the degree of education among the criminal population. The results in detail of this particular portion of the inquiry will be found in the following Table XXVI.

[The following Abstract

*Educational Condition of Criminals according to the classification of TABLE XVIII.*

| Number and Ratio of Criminals in the Section of Inferior Degree of Education in the General Community. |                                   |                 |                                       |                 |                                |                 |                        |                 |                                       |        |        |

A remarkable feature presents itself in these Abstracts. The form in which they are arranged shews not only districts in which there is an inferior degree of education in the general community, accompanied with an increased amount of criminals, but also at the same time an increased ratio of uninstructed criminals in the same districts, compared with that in the higher educated districts, and a reduced rate of crime. The agreement, therefore, of those two very different educational tests, and their general assimilation throughout, may be safely regarded as sufficient indications of the relative amount of actual education in the respective districts; and, consequently, should any uniform or constant increase or decrease of crime be found to fluctuate with the amount of education thus determined, it will furnish the argument for or against the influence of education on the development of crime.

From the preceding Abstract however, it appears that in all the eleven combinations represented there is a marked difference in favour of education; or, in other words, there is constantly an increased ratio of uninstructed criminals where crime is above the average, and also a reduced ratio of uninstructed criminals where crime is at a lower ebb. In the greatest agricultural district it will be seen that in the group in which crime is least, there is 6.5 per cent. less of uninstructed criminals than in the other group of the districts where a higher ratio of crime prevails. Again, take the districts in which the manufacturing and agricultural interests are nearly equal, and it will be found that in the group of least crime, there is 9.3 per cent. less of uninstructed criminals than in the parallel group of higher crime. Also, take the groups representing those districts of the country in which persons who marry signing the register with their marks, exceed the average of the country by  $33\frac{1}{3}$  per cent., and likewise in which those so signing are less than the average by 25 per cent., and it will be found that the former shews an increase of 43.9 per cent. during 1842-4, and of 35.6 per cent. during 1845-8 of crime over the latter district, and at the same time an increase of 7.3 per cent. of uninstructed criminals throughout the whole period. In this instance, as well as in all the others referred to in the same Abstract, we may observe the following most important combination repre-

[sented :—the districts

TABLE XXVIII.

*Shewing the relative degree of Instruction among Criminals in each class of Offences.—Males and Females.*

sented:—the districts of the country in which the general population is worst educated, the districts in which the greatest amount of crime prevails, and the districts in which there is the highest proportion of uninstructed criminals, are found constantly assimilating; while, on the other side of the question, we have to view those districts of the country which are best educated, the least criminal, and in which a less proportion is found of uninstructed criminals, identified. Since it thus appears, by adopting either of the available tests of education, that crime and ignorance are constant companions, prevention being better than cure, it becomes an important, if not an imperative duty, to reduce the amount of crime by the simple means of a good general education. As already stated, education in its higher sense must of necessity dis severate itself from crime, and this eminent degree of education will perhaps be long impossible of attainment to the whole population of any country; but there seem to be no insuperable difficulties in the way of imparting to the bulk of a community something above the mere elements of reading and writing at least; and in this limited sense it is evident there is to be found a powerful check on crime, and no doubt the most efficient means of subduing the evil propensities of the people.

In the preceding Table XXVIII, an analysis will be found of the educational condition of criminals during the years 1836, 7, 8, 9, for each of the six classes of crime given in the Home Office Returns.

1. Offences against the person.
2. Offences against property committed with violence.
3. Offences against property committed without violence.
4. Malicious offences against property.
5. Forgery and other offences against the currency.
6. Other offences.

The facts were thrown into this form with a view to determine, if possible, whether there was any, and what difference in the education of criminals committed for various classes of offences. It will be seen from the following abstract of this Table, that the proportion of criminals who could neither read nor write was highest in the class (3) for offences against property committed without violence, and least in the class (5) of forgery and other offences against the currency; being 35·29 in the former, and 24·44 in the latter, who could neither read nor write. Again, the ratio of those who could *read and write well* was least in the class (2) of offences against property committed with violence, being 9·53 per cent., and highest in the class (5) of forgery and other offences against the currency; and those of superior instruction were also lowest and highest in the same two classes, being only ·23 in the former class, and 2·25 in the latter. The results for the whole of these classes combined during the same years, were of those who can—

| ... could read and write well . .      | 9.46            | 4.25            | 4.70            | ...             | 5.80            | 11.81           | 5.13   |
| ... of superior instruction . . . .    | .29             | ...             | .17             | ...             | ...             | .20             | .17    |

The ratio of those who could neither read nor write is thus lowest for class (4), and highest for class (5), being 31.82 per cent. in the former, and 47.34 in the latter ; but during those four years it appears that in the class (4), for malicious offences against property, there was not a single one in the whole of England and Wales returned as being able to read and write well, or as possessing superior instruction ; so also in the class (2), of offences against property committed with violence, and in the class (5), of forgery and other offences against the currency, not a single instance occurred in the whole kingdom during those years, of a person being committed possessing superior instruction. Amongst females, class (1), including the offences against the person, seems to be the most remarkable, as the ratio of those who could

Neither read nor write, was . . . . . 32.81 per cent.

Read and write imperfectly . . . . . 57.45 ...

Read and write well . . . . . 9.46 ...

The following will exhibit the relative degrees of education in the aggregate of the criminal classes of both sexes during the years 1836, 1837, 1838, and 1839.

| Degree of Instruction.                   | Males. | Females. | Difference. |
|------------------------------------------|--------|----------|-------------|
| Ratio who can neither read nor write . . | 34.16  | 39.70    | — 3.54      |
| ... can read and write imperfectly       | 53.94  | 55.00    | — 1.06      |
| ... can read and write well . .          | 11.33  | 5.13     | + 6.20      |
| ... of superior instruction . . . .      | 0.57   | 0.17     | + 0.50      |

It will thus be seen, that although a higher ratio of females were able to read and write imperfectly, still a greater proportion of females could not read or write at all ; and, while 5.13 per cent. only of females could read and write well, there was 11.33 per cent. of the males who were equally instructed.

It may appear anomalous, while education is held to have so powerful an influence in repressing crime, and the female criminals are less educated than the males, that the ratio of crime is not also greater in the female sex. This argument, however, would be based on a very narrow and limited view of the question, for the application of the mere test of education itself will not always be sufficient to determine the relative amount of crime. Before applying this or any other test, it is necessary, in order to see its full influence or effect, that the two districts or groups compared should be similar in all other conditions, social and otherwise, and simply differing in regard to the one element, the

force of which it was proposed to measure. Among the various elements influencing crime, sex has already been shewn to be a most important one, as on the aggregate of ages the tendency to crime in the male sex was to that in the female sex, as  $\cdot 2978$  is to  $\cdot 0633$ —in fact, nearly as five to one. It is not enough to take into view simply the mental and moral conditions of the mind itself, but those conditions in relation to external circumstances and the state of society; and whatever may be the state of education and the natural feelings and passions peculiar to the female mind, sufficient has been shewn in the former paper, to prove that the difference in her social position in this country exposes her to less temptations to crime. In like manner does the same evidence prove, that while the state of education remains unaltered or constant in the country, crime may be fluctuating or gradually increasing or decreasing under the influence of the altered external circumstances with which man is surrounded; so also may the education of the people increase and become more general—as appears to be the case from the facts disclosed by the registers of marriage, which shew that the proportion of males signing the register with marks has gradually changed from 33·7 per cent. in 1839, to 31·2 per cent. in 1848; while, during the same years, the proportion of male criminals that can neither read nor write has decreased from 33·53 per cent. to 31·9 per cent.; and all this time crime may have likewise increased, but still it will remain a fact, that education counteracts the tendency, so long as the criminal returns shew that, everything else being the same, crime is at a minimum where education is at a maximum, and that where education is least, crime is highest. Changes in the political, manufacturing, and commercial aspects of the country—alterations in the police and criminal laws—have all their influence; and although for a period, or even a long series of years, crime may be on the increase, education may still be importantly concerned in the development or repression of crime.

Nothing has yet been said on the nature and extent of the various descriptions of crimes and offences. In the early part of this communication it was shewn, that in investigating the question of crime in its aggregate character, no satisfactory or true results could possibly be obtained, unless the element of age entered into the inquiry. If it be, then, so essential an element in discussing the question of crime in its general aspect, it must be evident that in its specific form there is still less chance of success, when without the means of employing the element of age. It is, therefore, to be lamented, that although in the Home Office Returns the number of criminals guilty of particular offences is given, no mention is made of their ages in connection with specific forms of crime. This defect might easily be remedied. Local and provincial police-courts and districts have seen the value of such information; and it is to be regretted that the authorities at head-quarters should still be indifferent to the great advantages that must result from affording inquirers into criminal statistics a means of introducing so important an element into their investigations.

It was not known at the time of writing this paragraph, that the Home Office had actually furnished the information required, respecting the ages of the persons committed for each class of crime, up till the year 1839; and that in subsequent years the returns have been presented in their present defective state. What could be the reasons for relinquishing their earlier plans, it is difficult to imagine. All the criminal returns for the six years 1834–1839, have been analysed, as shewn in Tables XXIX and XXX preceding for each class of crimes, and the population calculated by the formula given in pp. 2–3 *ante* for each year, and for each term of life, in order to discover the tendency at various ages to particular classes of crime.

These Tables explain themselves, being on precisely the same model as Tables I and II, only that Table XXX, instead of shewing the tendency to crime in the aggregate at each age, points out the tendency to particular classes or kinds of crime.

The following Abstract presents the general results arrived at:—

*Ratio per cent. of Criminals to the Population, yearly, at various terms of life, in each class of offences.*

| Total. . . .          | 4147·66         | 5561·73         | 532·20          | 62111·80        | 23310·02        | 7490·64         |

It will be recollected that when, on a former occasion, crime was viewed in the aggregate, the tendency to crime at various terms of life was shewn to follow a very remarkable law. From the age of 20 it was found that the tendency to crime in the male sex decreases at the rate of 33·333 per cent. for each term of life given in the Tables; but,

as anticipated, it will now be found that age becomes of still more importance in the investigation, when considering specific forms of crime. Some striking examples of this will be seen by referring to the preceding Abstract, and comparing the results in the different classes at ages "21 years and above 16," with the following terms of life, in which the tendency to crime is

In the class (1) of offences against the person at ages

|                                |        |
|--------------------------------|--------|
| 21 years and above 16.....     | ·05622 |
| 30     ...     ...     21..... | ·06800 |

Difference = ·01178 or + 20·95 per cent.

Again, in class (2), offences against property, with violence, at ages

|                                |        |
|--------------------------------|--------|
| 21 years and above 16.....     | ·07613 |
| 30     ...     ...     21..... | ·04643 |

Difference = ·02970 or - 39·01 per cent.

In class (3), offences against property, without violence, at ages

|                                |        |
|--------------------------------|--------|
| 21 years and above 16.....     | ·59929 |
| 30     ...     ...     21..... | ·39109 |

Difference = ·20820 or - 34·89 per cent.

In class (4), malicious offences against property

|                                |        |
|--------------------------------|--------|
| 21 years and above 16.....     | ·00428 |
| 30     ...     ...     21..... | ·00394 |

Difference = ·00034 or - 7·94 per cent.

In class (5), forgery and other offences against the currency

|                                |        |
|--------------------------------|--------|
| 21 years and above 16.....     | ·01208 |
| 30     ...     ...     21..... | ·01114 |

Difference = ·00094 or - 7·77 per cent.

It is, therefore, obvious, that the law which regulates the tendency to crime at different ages is not the same in every class. For, while in the class of offences against the person, there is an increased tendency at "30-21" of 20·95 per cent. above that shewn in the preceding term of life, there is in all the other classes a less tendency, varying from 39·01 per cent. in offences against property with violence, to only 7·77 per cent. in cases of forgery and other offences against the currency. At other ages, like differences will be found. The difference between the tendency to crime in class (2) at ages 40-30 and 50 40 is, 63·12 per cent., but the difference at the same age in class (4) is only 8·90 per cent.

The importance to criminal jurisprudence of a solution of this problem must be evident. No preventive measures can possibly be adopted till the knowledge exists of the particular tendencies to certain propensities and forms of crime at different ages. With a clear knowledge of these, however, the chances of success in averting crime must be greater, as the means are furnished of knowing in what particular sections of the community the strongest tendency exists to specific forms of crime.

On reflection, it will now be seen, with still greater force than formerly, that a necessity exists for a very refined analysis in investigations on crime, before drawing any conclusions. The importance of determining the ratio of crime at the different terms of life, in order to know the relative amount of crime in different districts, as well as to understand whether crime be on the increase or decrease, has already been shewn. It also appears equally important to determine the tendency at the respective ages to the specific forms of crime, otherwise the perturbations of which the various classes are susceptible may vitiate conclusions based on any evidence resting on mere general averages.

In the final column of Table XXX, will be found the expression for the tendency to crime in the aggregate of those six classes during the years 1834-1839. In this Table a peculiarity will be observed in the division of ages, but the population has been determined for the same ages by the methods already pointed out. The present division of ages commenced only with the reports for the year 1842. It will be found that above 20 years of age the amount of crime was less in the years 1834-1839 than in the period 1842-1844, and the following Abstract will shew the relative amount and tendency to crime at the two periods referred to.

| AGE.                 | Ratio per cent. of Criminals in |         | Excess per cent.<br>of Crime in 1842-4.<br>above 1834-9. |
|----------------------|---------------------------------|---------|----------------------------------------------------------|
|                      | 1842-4.                         | 1834-9. |                                                          |
| 15 to 20 . . . . .   | ·6841                           | ·7839   | — 14·588                                                 |
| 20 ... 30 . . . . .  | ·6952                           | ·5566   | + 19·937                                                 |
| 30 ... 40 . . . . .  | ·3794                           | ·2928   | + 22·825                                                 |
| 40 ... 50 . . . . .  | ·2505                           | ·1725   | + 31·110                                                 |
| 50 ... 60 . . . . .  | ·1694                           | ·1202   | + 29·044                                                 |
| 60 and upwards . . . | ·0813                           | ·0525   | + 35·424                                                 |

From the preceding Abstract it will be seen, that from 20 to 60 years of age, there has been an excess of crime in the period 1842-1844 over that of 1834-1839, varying at the different ages within that term of life from about 20 to 31 per cent.; and it will be found, on referring to page 327, that the tendency to crime in the intermediate period of years 1840-1841 was something like a mean between the results given in the preceding Abstract, thus pointing to a gradual increase in the criminal calendar of the country within

those periods; but on examination of Tables XXII and XXIII, and also of the Abstracts on page 327 it will be found that a marked reaction, particularly in the male sex, took place in the years 1845-48. One striking feature in the preceding Abstract is the fact, that while above 20 years of age there has been an increased ratio of crime within the period of 1842-44, there has been at the period of life, 15-20, a decrease of crime amounting to 14·588 per cent.; and on referring to the Second Abstract on page 327, a further diminution of crime at the same period of life to the extent of 6·388 per cent. will be found. This is contrary to the popular opinion held on the subject; but the preceding part of this paper also shewed that all the facts of the case went to prove that there was no increase of juvenile crime, and that if any change or movement be discovered in the criminal returns of any particular district, that change will be found to be promoted, not so much by fluctuations at the terms of life 10-15 and 15-20, as by the increase or decrease among those persons of more advanced ages. It is thus evident that over a period of fifteen years, ending December 1848, instead of there being an increase, there has been a positive decrease of crime among the population at the younger ages.

From the following Abstract it will be seen that the great amount of crime is due to one class (3) of offences—that which includes “offences against property committed without violence.”

| AGE.                 | Aggregate Crime during 1834-9. | Class 3 during 1834-9. | Per centage of Crime due to Class 3. |
|----------------------|--------------------------------|------------------------|--------------------------------------|
| 12 years and under . | ·01371                         | ·01259                 | 91·831                               |
| 12 to 16 . . . . .   | ·29770                         | ·26513                 | 88·979                               |
| 16 ... 21 . . . . .  | ·78386                         | ·59929                 | 76·453                               |
| 21 ... 30 . . . . .  | ·55660                         | ·39109                 | 70·264                               |
| 30 ... 40 . . . . .  | ·29282                         | ·21374                 | 72·994                               |
| 40 ... 50 . . . . .  | ·17254                         | ·12938                 | 74·985                               |
| 50 ... 60 . . . . .  | ·12018                         | ·09136                 | 76·020                               |
| 60 and upwards . . . | ·05242                         | ·03908                 | 74·467                               |

This Abstract at once points out the necessity for remedial measures being applied to the removal of this class of offences, which constitutes about three-fourths of all the crime in the country committed during maturer life. It will be further seen that nine-tenths of the whole amount of crime, by those of 16 years of age and under, is included in the same class; and, on reflection, it must appear evident, that very simple measures may, without difficulty, be employed by the legislature for the removal of the causes, or at least for the prevention of the great bulk of these offences.

Although this contribution has already extended to considerable length, every one giving attention to the many curious and most instructive results which have been arrived at on the question which, perhaps above all others, bears most directly on the

present and future happiness of the great mass of the people, will regret to find that any further useful inquiry and investigation into the progress of crime in this country must cease and determine with the close of the year 1848; and the cause of this cannot fail to evoke the strongest disapprobation of every one possessing the least philanthropy and sympathy for the moral and social condition of his countrymen; in fact, ever since the year 1839, the Home Office Returns have been periodically undergoing such changes, and have been from time to time presented to the public in so imperfect a shape and form, that at last they have become next to useless, and are now, not only wholly unavailable as aids in any correct inquiry into the state and progress of crime in this country, but are positively dangerous in the hands of mere cursory observers, and eminently calculated to lead them to the most fallacious and destructive conclusions. I should not therefore venture to dwell on any of the statements set forth in those Returns subsequent to the year 1848, were it not to place on record the startling fact, that while, not only in this country but throughout the whole civilised world, greater attention is year after year given to the development of improved statistical methods, in all matters which are likely to affect the moral and material progress of a people, or are even calculated to throw light on questions of merely a curious and speculative character, our Home Office Returns of Criminal Offenders have, for the last fifteen years, been barbarously retrogressive, and are, at present, in such a state as to be discreditable to the Government, and unworthy of a country laying so great pretensions to the promotion of economic and statistical science.

On referring to the facts recorded in Table XXVIII, preceding, and likewise to the Abstracts in pp. 389-90, it will be found that during the four years, 1836-9, the degree of instruction amongst criminals was not only given in the aggregate, but for the criminals in each division or class of offences. It has already been shewn how important it is to distinguish between the conditions and circumstances under which different kinds of crime are committed; but so far as education, or rather instruction, is concerned, this has been quite impossible ever since the year 1839. Again,

In the years 1834-39, as will be found, on referring to Tables XXIX and XXX, and likewise to the Abstracts of them in p. 395, that for that period of six years the ages of criminals were distinguished for each class of offences. Since the latter-mentioned year no such distinction has been observed in the published returns, and, consequently, ever since 1839 the curious, interesting, and instructive results disclosed in pp. 387-96 have remained completely isolated, and no one can tell how far the conclusions arrived at from the experience of those six years are justified by the progress and development of crime during the last fifteen years.

Again: from the year 1840 the ages of criminal offenders were given, not only for the whole kingdom in the aggregate, but for each county, until the close of the year 1848. In 1842 a new classification of ages however took place: accordingly, Tables I and

XXIII, inclusive, of this contribution will be seen to be based on this arrangement of facts, and have permitted an investigation to be made into the progress of crime, but without distinction of the particular class of offences in connection with age. It is however to be regretted that from the year 1848 this has been quite impossible, the published returns not containing the necessary elements.

There is still another defect in the Home Office Returns which cannot be passed over in silence. It has already been shewn that up to the year 1839 the Educational condition of Criminals was given, not only in their aggregate capacity, but for each particular class of offences, and from that time until 1848 the educational condition was given for the aggregate of all offences, but since then it will be found that no mention has been made as to whether a single criminal was capable of reading or writing, or possessed any degree of education or instruction whatever.

It consequently follows:—

- (a). That since the year 1848, neither the age nor the educational condition of criminals has been given even for the aggregate of all classes of offences.
- (b). Since the year 1839, nothing is known of the age of criminals in connection with specific classes of offences. And
- (c). Since the year 1839, nothing is known of the educational condition of criminals committed under each class of offences.

These have been already shewn to be elements of vital importance in every inquiry into Criminal Statistics, and it is certainly surprising to find that, having been once recognised in the Home Office Returns, they should, in an age in which it is so well known statistical science is forcing itself on the consideration of Governmental Departments, be so systematically discarded. There is yet another change, of more recent date, to which it may be well to allude before concluding this subject.

On examination of the Home Office Returns, it will be found that, until the year 1851, they distinguished the numbers of males and females in each class of offenders in every County in England and Wales, without taking notice of the other important elements referred to in paragraphs (a), (b), and (c) immediately preceding; but since the year 1851, no distinction even of sex, has, under this meagre aspect of the question, been recognised by the authorities of the Home Office.

The following Tables, constructed from the published Returns for the years 1849-53 inclusive, are therefore only given by way of contrast, and as a practical illustration of the changes of which a Governmental Department is really capable of effecting at a time when the Governments of Europe and America are, by their Deputies, periodically assembling in Congress to improve and systematise the records of all facts and phenomena bearing on the happiness, prosperity, social progress, and moral and intellectual elevation of the people.

The following is an Abstract of the preceding results, so far as the same is practicable, thrown into the same form as Tables XXVI and XXVII preceding.

TABLE XXXII.

*Abstract of the Criminal Returns for the Five Years 1849-53, so far as it has been possible to make the defective returns of those years available. From the explanatory remarks already furnished, it will be seen that no distinction of sex has been made, no return of ages is given; and therefore it has been impossible to apply the consequent corrections pointed out in the early part of this paper, as being so essential in every correct inquiry. No notice has been taken in the Home Office Returns for the same Five Years of the educational condition of offenders: and from these defects this and Table XXXI preceding cannot receive the same confidence as the other Tables of this contribution.*

The following is an Abstract of the preceding results, so far as the same is practicable, thrown into the same form as Tables XXVI, XXVII, and XXXI preceding.

TABLE XXXIV.

*Abstract of the Criminal Returns for the Two Years 1854-5, so far as it has been possible to make the defective returns of those years available. From the explanatory remarks already furnished, it will be seen that no distinction of sex has been made, no return of ages is given; and therefore it has been impossible to apply the consequent corrections pointed out in the early part of this paper, as being so essential in every correct inquiry. No notice has been taken in the Home Office Returns for the same Years of the educational condition of offenders: and from these defects this and Tables XXXI, XXXII, and XXXIII preceding cannot receive the same confidence as the other Tables of this contribution.*

## RECAPITULATION.

The facts brought forward in this paper lead to the following conclusions:—

1. That the tendency to crime among the male population at various terms of life varies from  $\cdot7702$  per cent. at the term of life 20–25, to  $\cdot1694$  per cent. at ages 50–60, or, in other words, the tendency to crime at one period of life is more than quadruple that at another\*. Age appears to have a similar influence on the tendency to crime in the female sex.

2. That the tendency to crime in the male sex is nearly five times as great as in the female sex. Over the whole male population of England and Wales, at all ages, the tendency to crime is  $\cdot2978$  per cent., and for the female sex it is  $\cdot0633$  per cent.,—that is to say, one in every 336 of the male population is yearly guilty of a criminal offence, and in the female sex, one in every 1581†.

3. That in the various districts and counties of England and Wales there is a remarkable difference in the distribution of the population over the various terms of life. In the counties of Anglesea, Carmarthen, and Dorset, the proportion of the whole population alive at the quinquennial term of life, 20–25, is less than 8 per cent.; but in Lancaster, Middlesex, and Monmouth, the proportion varies from 10 to upwards of 11 per cent.: and at other periods of life like differences will be found‡.

4. It hence follows, that if even the tendency to crime were precisely the same at the respective terms of life in those districts, there would still be, in reference to the whole population, an apparent increase of crime in the last three counties, from the fact that they contain a greater proportion of their population at the term of life at which the tendency to crime is the greatest. This truth is established by the facts, that during the years 1842–3–4 the actual proportion of male criminals in England and Wales was 1 in 336 of the whole male population§; but if the population had been under the same distribution in regard to age as in the year 1821, the proportion of criminals would have been 1 in 365 only, and if under the same distribution as in the city of Glasgow, crime would appear as high as 1 in every 304||. Again, the difference of distribution of even two districts of the metropolis is such as to produce in Bethnal Green the proportion of 1 in 338, while in St. George's, Hanover Square, the ratio would be as high as 1 in 280¶; manifesting an error, in any method of inquiry neglecting the element of age, of about 21 per cent. An inspection of the results obtained in the early part of this paper will shew that a uniform tendency to crime in each county at the respective terms of life would, in consequence of the difference in the distribution of their populations according to age, produce in Anglesea, Cardigan, Carmarthen, Dorset, Merioneth, Montgomery, and

¶ See Table VII.

Pembroke, the ratio of one crime yearly to every 360 of the population; but in Glamorgan, Lancaster, Middlesex, and Monmouth, the same tendency to crime would produce as high an average as from 1 in 325 to 1 in 313, being a difference of at least 18 per cent.\* It is, therefore, evident, that the element of age is an essential item in every inquiry or investigation into the relative amount and progress of crime in different districts; and on the same evidence the element of sex must appear equally important; and hence calculations in which those elements are neglected cannot be relied on as shewing the relative amount of crime in different districts, nor in the same districts at different periods of time: for here we have an apparent difference of crime in some districts to the extent of 20 per cent. above that in others, in which the same tendency to crime has been assumed to prevail, accounted for by the simple fact of a difference in the distribution of their population; and other differences of even greater extent are found to depend on the relative proportion of the sexes in the respective districts. Hence the great necessity in all such inquiries, of having recourse to those elements, in order to determine the relative amount of crime, and the danger of depending on any conclusions arrived at by any methods of inquiry in which they are neglected.

6. That every properly conducted inquiry into criminal statistics, intended to shew the relative tendencies to crime in different districts, or in the same district, at different periods, must distinguish the amount and degree of crime in each sex, and shew the amount and tendency to crime for each sex and at every term of life for given districts at the respective periods of time†.

7. That the tendency to crime at each successive term of life given in the Tables decreases from the age of 20 at the rate of 33·333 per cent. for the male sex, and at the rate of 25 per cent. for the female sex‡.

8. That in some counties or districts, crime is upwards of 50 per cent. above the average of the kingdom, while in others it is nearly 70 per cent. below the average§.

9. That in all the agricultural groups of counties there seems to be a remarkable uniformity in the tendency to crime, varying in an excess of crime above the average for the whole kingdom of 5·3 per cent. to 6·8 per cent.; but in the mining and manufacturing groups of counties, although the whole combined shew less than the average crime for England and Wales, still in one portion of the groups there is an excess of 33·5 per cent. of crime; while in another, crime is 52·1 per cent. below the average||; proving that there must be some powerful element in the social and moral state of the people, not eliminated in such combinations, producing this remarkable disparity.

10. That the usual test by which the manufacturing and agricultural counties are determined, may often be neutralized by a corresponding high or low ratio of agriculturists

\* See Table VII.

† See Tables I and II, also Tables XXII and XXIII.

‡ See Tables I and II, also Tables XXII and XXIII; and likewise Abstracts pp. 326-7.

§ See Table XI.

|| See Tables XII and XIII.

and manufacturers in each: but adopting corrections as in Tables XIV and XV, to avoid such errors, and testing the counties in which the most striking differences exist as to their agricultural and manufacturing conditions, it is found that the mere fact of such differences in the habits of the people has little or no influence on the increase or decrease of crime, and offers no solution to the problem of what is that element or feature which produces in one great community an excess of 52·1 per cent. of crime, and in another community reduces crime 33·5 per cent. below the average\*.

11. That by adopting the test of education or instruction furnished by the marriage registers of the country, and further analysing the groups referred to in the preceding paragraphs, by dividing each into two sections—by the one of which will be represented the population of highest education, and the other the population of lowest education;—in fact, so analysing the various districts and groups of counties, that they differ in respect of education only,—it is found, that out of the 22 different combinations formed of the various districts of England and Wales, in every instance there is an excess of crime where there is the least education or instruction: and comparing the respective sections of each group of counties, it will be seen that there is an average excess of 25 per cent. of crime in the sections of inferior education over that of higher education, and in some districts the excess is as much as 44 per cent.†

12. That it is hence obvious that the very small amount of education, or rather instruction, implied by the test here adopted, has a powerful influence on the criminal calendar of the country; and that the introduction of this further element into the investigation of the relative amount of crime, removes many anomalies not otherwise to be understood‡.

13. That all the preceding conclusions are arrived at from facts derived from a source partly independent of the criminal population itself; but this Contribution also furnishes evidence establishing the fact, that invariably, in those districts in which there is an increased amount of crime, there is also a higher ratio of uneducated criminals, and in the less criminal districts a smaller proportion of the criminal population wholly destitute of the rudest elements of education; and, in following up this inquiry, the following remarkable combination of elements determine the great influence of education in the development of crime. The districts of the country in which the general population is the worst educated, the districts in which the greatest amount of crime prevails, and the districts in which there is the highest proportion of uninstructed criminals, are constantly found assimilating; while, on the other hand, those districts which are the best educated, the least criminal, and in which a smaller proportion of uneducated criminals prevails, are likewise found to be identified in the various combinations§: and hence the great reduction of crime to be justly expected from the general diffusion of education.

\* See Tables XIV and XV.

† See pp. 363–4, and Table XVIII.

‡ See page 364.

§ See pp. 377–9, also Tables XXIV to XXVII inclusive.

14. That the highest proportion of criminals in the male sex wholly destitute of education is to be found in those committed for offences against property without violence—and least in the class of forgery and offences against the currency; but for the female sex, the lowest ratio was found in malicious offences against property, and the highest in the class of forgery and offences against the currency\*.

15. That the simultaneous increase of education and crime does not necessarily prove that education has no material influence on crime, so long as the criminal returns shew that, all other conditions being the same, crime is at a minimum when education is at a maximum, and *vice versa*. Changes in the political, manufacturing, and commercial aspects of the country—alterations in the police and criminal laws—have all their influence; and although for a period, or even a long series of years, crime may be on the increase, education may still be importantly concerned in the repression of crime†.

16. When viewed in its aggregate character, it is found that at the inferior ages there is a greater tendency to crime than at superior ages; but when viewed in its specific character, it is found that this law does not prevail: for while, in the class of offences against the person, at ages 21-30 there is an increased tendency of 20·95 per cent. above that for the preceding term of life, in all the other classes there is a less tendency, varying from 39 per cent. in offences against property with violence, to only 7·77 per cent. in cases of forgery and other offences against the currency: and at other ages, like differences will be found‡.

17. That it is hence evident, that no conclusions, as to the prevalence of crime, can be safely arrived at in questions of criminal jurisprudence, unless a proper analysis be made for the districts under investigation, shewing the tendency which exists to the specific forms of crime—and that too for each sex and at each term of life: for here we find, for two terms of life, a difference of 60 per cent. in the amount of crime dependent on the relative prevalence of two specific forms of offences; and it consequently follows, assuming in different districts the criminal tendencies of the population to be precisely the same, that (a), the fact of a difference in the distribution of the population at different ages will produce an apparent excess of crime, from the circumstance, that in some districts there is an excess of population at that term of life in which the tendency to some peculiar forms of crime is in maximum or in minimum;—or (b), on the other hand, assuming the distribution to be nearly, or exactly the same in two districts, a difference in the tendencies to specific forms of crime may be concealed by the neglect of the element of age or sex, and the districts falsely concluded to be in similar conditions as to their criminal manifestations; and a third error, (c), may result from the neutralising influences of these disturbing causes balancing each other. The excess of population at one particular term of life favourable to the

\* See pp. 389-91, also Table XXVIII.

† See pp. 390-1.

‡ See pp. 395-6, also Tables XXIX and XXX.

manifestation of a particular form of crime, may be counteracted by an equivalent amount of reduction in the tendency to the development of that specific form of crime: and hence all ignorance of these perturbations, and the remedial measures which a knowledge of them would induce. In criminal inquiries, therefore, they constitute elements of every correct investigation\*.

18. That although it has been usual of late to refer to juvenile delinquency in explanation of the increase of crime in many districts, the facts here presented do not sustain the supposition. An inspection of the nine groups of combinations represented in Tables XII and XIII, will shew, both for the general result, and for each group, that any increase or decrease in the amount of crime, as compared with the average of the country, is not accounted for so much by fluctuations in the tendency to crime at ages 10-15 and 15-20, as by the increase or decrease of crime at more advanced ages; leading to the conclusion that in the juvenile period of life the tendency to crime is under the influence of more constant laws or elements, and therefore shews less fluctuation than in mature life, when the conduct and disposition of individuals come more under the control of external circumstances. Further, a comparison of the results set forth in Table I and in Table XXX, shews that, from 20 to 60 years of age, there has been a gradual increase of crime, from the year 1834 to 1844, of from 20 to 31 per cent. varying with the age; but during the same years there has been at the younger ages, 15-20, a uniform decrease of 14·588 per cent., and in the four years, 1845-8, a further decrease of 6·388 per cent.; thus proving, by the facts of the case, that during a period of fifteen years, ending December 1848, there has been a decrease of crime among the population at the younger ages.

19. That to one class of offences—those against property committed without violence,—are due three-fourths of the whole crime of this country; and among the population of 16 years of age and under, more than nine-tenths of all their crimes belong to this single class of offences†.

20. That the nature of these offences obviously places the offenders within the reach of such remedial measures as would certainly, to a great extent, remove them from the criminal calendar, and thus go far toward the prevention of at least three-fourths of the crimes of this country.

\* See Tables I and II, and also Table XXX.

† See Table XXX.

## INFLUENCE OF LOCALITY ON SICKNESS.

---

THE next question to be brought under consideration is the Influence of Locality on the amount of Sickness among the members of Friendly Societies.

In Tables E and L, pp. 20-7 and 68-75 *ante*, the amount of sickness is given among a certain number of persons, at every year of life, expressed in weeks and decimals of a week; and in an adjacent column will be found the amount of sickness among the same number of persons in quinquennial periods of life, also the average amount of sickness to each individual per annum. In the same Table the amount of sickness under the various arrangements described for each of the Districts recognised in the Tables of Mortality is also given; and an inspection of the last column will give a general idea of the relative amount of sickness in those Districts.

Table V following has been formed from the last column of Tables E and L, by interpolating the terms for the intermediate years of age, by the method of third differences; and the adjusted results were afterwards obtained in the same manner as that described for the rates of mortality in Tables C and F, in the early part of this paper.

Owing to the greater practical convenience of collecting and arranging the data, as well as of subsequently applying the results to the more useful purposes of friendly societies, the amount of sickness throughout the whole of this paper is invariably expressed under the denomination of weeks. For example, in Table V, opposite to age 35, and under the head "Rural Districts," the decimal expression  $\cdot 8991$  signifies that the average amount of sickness to each individual per annum is that fraction of a week. And again, opposite the same age, in the column "City Districts," the average amount of sickness to each person in the course of a year is 1.2372 weeks. When, however, it is required to change the expression to the more scientific denomination of the fraction of a year, that may be easily done by multiplying any of the results by  $\cdot 019165$ .

[An examination

An examination of the rates of sickness as given for the Rural Districts will shew that it fluctuates up to the age of 32, and that from that age up to 87 there is a uniform and gradual increase. In the Town Districts the rate of sickness will be found subject to a similar increase from the age of 27 upwards; and in the City Districts the rate increases throughout the whole range of the Table. A comparison will shew a higher rate of sickness in the Town than in the Rural Districts, for the whole period of life. The rate of sickness in the City Districts will also be found higher than in the Rural Districts, from 23 to 63 years of age; it then continues at a lower rate up to the age of 75, when it again rises, and continues higher till the end of life. In the City Districts, from the age of 24 to 44, the sickness is also higher than in the Town Districts; but from 45 to 57 the rate in both Districts differs but little. After 57 years of age, to the end of life, there is a much higher rate of sickness in the Town than in the City Districts. The following Abstract of Table V will give a general view of the relative amount of sickness in the various Districts.

| Ages. | Average Sickness per Annum to each person—expressed in Weeks. |                 |                 |                               |

Sickness will be found to follow to some extent the same law with regard to the influence of locality, that was observed to connect itself with mortality; being least in the Rural Districts, and increasing in amount in the other Districts; but it will be observed that the relation of cause and effect generally supposed to exist between sickness and mortality is not here manifested—in fact, the highest ratio of sickness is sometimes found associated with a favourable rate of mortality. In order to shew, however, the merits of this hypothesis for the general results of the Three Districts, a Table is subjoined shewing the increase per cent. in the rate of mortality in the Town and City Districts above the Rural, also the increased rate of sickness in the same Districts at the corresponding ages.

| Age. | Increased Mortality per Cent. above the Rural Districts in the |                | Increased Sickness per Cent. above the Rural Districts in the |                 | Age. |

| 20   | 27.6008                                                        | 12.7200        | 2.1104                                                        | 32.7650         | 20   |
| 30   | 5.4852                                                         | 30.5204        | 0.4684                                                        | 26.3338         | 30   |
| 40   | 20.4517                                                        | 75.7842        | 18.6560                                                       | 37.3419         | 40   |
| 50   | 35.5833                                                        | 61.6666        | 60.7220                                                       | 49.9182         | 50   |
| 60   | 51.5277                                                        | 41.0185        | 27.5130                                                       | 16.7200         | 60   |
| 70   | 43.2990                                                        | 26.7248        | 9.1906                                                        | 29.8191         | 70   |

In addition to this, abundant evidence, illustrative of this point, is furnished out of the present materials. For example, labourers, although influenced by the most favourable rate of mortality, are found to be subject to as high an amount of sickness as the general average; and so some other occupations also, in which the rate of mortality is also favourable, are found subject to a rate of sickness much above the average.

Again, the sickness among the sixteen trades referred to in pp. 58 *et seq.*, *ante*, is less than the general average, although, as has been shewn, they experience a greater mortality. Bakers also, at the early and middle periods of life, are less subject to sickness than the general average, and among them there is likewise a higher mortality. The class of Butchers seems to experience a very high rate of mortality, although not subject to above the average amount of sickness. In applying the test of mortality to various localities and employments there is no difficulty; but the case is very different in viewing sickness as an index of the sanitary condition of any trade or of any locality. What constitutes sickness in one case, is often a very different thing from that in another. The standard seems too indefinite and capricious; and although the results as obtained may be considered perfect for all the purposes of friendly societies, a careful inquiry will shew their vague nature for medical and other scientific purposes, unless carried further than the mere amount of sickness, without regard to the circumstances under which it has taken place, and the causes producing it. Taking two occupations—Tailors and Clerks—which happen to be of readiest reference, they are found subject to a very high rate of mortality; still they do not seem, particularly Clerks, to be subject to so much as the average amount of sickness; and on consideration of the nature of those employments, it will immediately suggest itself, that the same trivial circumstances which would be sufficient to disable Sawyers, and also Colliers and Miners, would have little effect on those following quiet occupations. Sawyers, Colliers, and Miners are subject to accidents and various injuries which cannot be considered constitutional disease or sickness; yet it entitles them to relief from benefit societies, and they will of course be returned on the sick list. Tailors and Clerks are less subject to those accidents, and accordingly their sickness is also less; the other classes, particularly Colliers and Miners, being much above the average.

But the most striking refutation of the theory, that sickness and mortality bear the relation to each other of cause and effect, will perhaps be derived from a comparison of the general results of mortality in friendly societies in England for all districts combined, as given in Table F, page 32, with that for Scotland in Table M, page 80 *ante*. The result of this comparison will be, that the rate of mortality in Scotland among the members of friendly societies is found to be much higher than among the same class in England; and if the theory just recited were to hold good, there should also be found a greater amount of sickness in Scotland; but an inspection of Table V in this paper will shew that such is not the case, and that instead of there being an increased ratio of sickness, the ratio is actually below that in England. Nothing further, therefore, need be said on this part of the subject; but the argument may be rendered more obvious by an inspection of the following Abstract, in which it will be seen that while the excess of mortality is uniformly against Scotland, the excess of sickness is as constantly against England.

| Age. | Mortality per Cent. in |           | Excess of Mortality in Scotland per Cent. | Average Sickness yearly in |           | Excess of Sickness in England per Cent. |

The nature of the information in the schedules relating to the societies in England would evidently satisfy many speculations as to the cause, duration, and mortality of sickness and disease; but as it is proposed to give in this paper a simple representation of the amount of sickness only in the different districts, all inquiries, however interesting and instructive, as to the ratio of sickness to mortality, under the various circumstances which present themselves of employment and disease, must for the present remain untouched.

The next part of the subject naturally arising in this paper is, the relation which the average amount of sickness, as developed by this inquiry, bears to the amount of sickness as hitherto shewn in other sickness Tables.

The only Tables published prior to the first edition of this work to which it is deemed necessary in the first place to make reference, are those contained in the Highland Society's Report for 1824, and the Tables given in the highly valuable work by Mr. Ansell on friendly societies, and published in 1835 under the superintendence of the Society for the Diffusion of Useful Knowledge. The following will shew the relative amount of sickness per annum to each person at given ages according to those Tables, and also according to the results of the present inquiry.

TABLE W.

*Sickness per Annum to each Person—expressed in Weeks.*

| Age. | Highland Society. | Ansell. | Three Districts Combined, Table V. | Age. | Highland Society. | Ansell. | Three Districts Combined, Table V. |

| 20   | ·575                                                         | ·776    | ·840                               | 31·5476                                  | 7·6190                         |
| 30   | ·621                                                         | ·861    | ·911                               | 31·8331                                  | 5·4884                         |
| 40   | ·758                                                         | 1·111   | 1·181                              | 35·8171                                  | 5·9272                         |
| 50   | 1·361                                                        | 1·701   | 1·960                              | 30·5612                                  | 13·2142                        |
| 60   | 2·346                                                        | 3·292   | 4·166                              | 43·6869                                  | 20·9798                        |
| 70   | 10·701                                                       | 11·793  | 14·039                             | 23·7766                                  | 23·0636                        |

The remarkable increase in the amount of sickness, as shewn by the present results, beyond the two other Tables, will no doubt appear very startling to those not intimately

familiar with the condition of friendly societies throughout the country. The rate of sickness as given in the Table of the Highland Society has been long and generally acknowledged to be much below the actual average, and even so far back as 1825 it was thought unfavourably of by a Committee of the House of Commons. It is unnecessary to enter into the objections against the nature and source from which the data for the Highland Society's Table were obtained, as that subject has been amply discussed elsewhere. For some time after Mr. Ansell's work appeared, it was thought that contributions calculated according to the increased amount of sickness shewn in his Tables would render friendly societies perfectly safe; but instances occur almost daily of societies breaking down, whose contributions approximate to those Tables; and recently the increased amount of sickness has become so apparent to the members of some of the best regulated societies, that meetings have been held, and reports of a very clear and apposite kind published, pointing to the increased amount of sickness as the cause of their falling condition. A knowledge of circumstances of this kind first led to the present inquiry, the original object of which was simply to answer the question, whether friendly societies were actually subject to a higher rate of sickness.

Mr. Ansell's data had reference to the five years 1823-27; and it is difficult to account for the difference between his Tables and the present results, unless it be considered that the imperfect manner in which the affairs of friendly societies at that period were managed, did not allow of so accurate information being then obtained as now, when required by Act of Parliament to make quinquennial returns. In Scotland, at the time even of collecting the data for this inquiry, it was found that quadruple the societies would have filled up schedules in competition for the prizes offered, but were prevented from doing so by the incomplete system in which their books were kept. It is not improbable that the difference of the two classes of results may be partially accounted for by the smallness of the numbers over which his observations extended, as in the aggregate they amounted to 24323 years of life only, or about 5000 persons for a period of five years. If this fact is considered, and at the same time the irregularities which peculiarity of employment and other circumstances have been shewn to produce, it will not be difficult to account for the discrepancy. If the nature of Mr. Ansell's treatise had required an enumeration of these features, it would have been interesting to have traced the cause.

It is not believed that the mere fact of small numbers would, of itself, be sufficient to account for the difference, without at the same time a peculiarity in the combination of the employments of the persons composing those numbers; for not the least remarkable feature which has appeared in the present inquiry is, the uniformity of the results as to sickness, with even smaller numbers than those included in Mr. Ansell's statement, when all the facts recorded were under similar circumstances as to locality and employment.

In order to give a still further and comprehensive view of the several Tables over periods of years, the following arrangement may be useful.

TABLE X.

*Comparative amount of Sickness in various periods of Years according to the Sickness Tables of the Highland Society, the Tables by Mr. Ansell, and the Results of this Inquiry.*

| From Age. | Amount of Sickness in each period of Years—expressed in Weeks. |         |                                  |                                         |                               |
|-----------|----------------------------------------------------------------|---------|----------------------------------|-----------------------------------------|-------------------------------|
|           | Highland Society.                                              | Ansell. | Average for the Three Districts. | Excess per Cent. over Highland Society. | Excess per Cent. over Ansell. |
| 20 to 30  | 5.870                                                          | 8.060   | 8.7145                           | 32.6410                                 | 7.5100                        |
| 30 ... 40 | 6.728                                                          | 9.535   | 9.9120                           | 32.1227                                 | 3.8035                        |
| 40 ... 50 | 9.670                                                          | 13.395  | 14.7999                          | 34.6617                                 | 9.4926                        |
| 50 ... 60 | 17.827                                                         | 22.565  | 27.0894                          | 34.1920                                 | 16.7120                       |
| 60 ... 70 | 47.982                                                         | 58.717  | 77.3029                          | 37.9290                                 | 24.0420                       |
| 70 ... 80 | ...                                                            | ...     | 205.3562                         | ...                                     | ...                           |
| 20 ... 40 | 12.598                                                         | 17.595  | 18.6265                          | 32.3652                                 | 5.5378                        |
| 30 ... 50 | 16.398                                                         | 22.930  | 24.7119                          | 32.8775                                 | 7.2107                        |
| 40 ... 60 | 27.491                                                         | 35.957  | 41.8893                          | 34.3723                                 | 14.1618                       |
| 50 ... 70 | 65.803                                                         | 81.279  | 104.3923                         | 36.9650                                 | 22.1400                       |
| 60 ... 80 | ...                                                            | ...     | 282.6591                         | ...                                     | ...                           |
| 20 ... 50 | 22.268                                                         | 30.990  | 33.4264                          | 33.3820                                 | 7.2888                        |
| 30 ... 60 | 34.219                                                         | 45.492  | 51.8013                          | 33.9416                                 | 12.1798                       |
| 40 ... 70 | 75.473                                                         | 94.674  | 119.1922                         | 36.6796                                 | 20.5703                       |
| 50 ... 80 | ...                                                            | ...     | 309.7485                         | ...                                     | ...                           |
| 20 ... 60 | 40.089                                                         | 53.552  | 60.5158                          | 33.7545                                 | 11.5074                       |
| 30 ... 70 | 82.201                                                         | 104.209 | 129.1042                         | 28.5841                                 | 19.2831                       |
| 40 ... 80 | ...                                                            | ...     | 324.5484                         | ...                                     | ...                           |
| 20 ... 70 | 88.071                                                         | 112.269 | 137.8187                         | 36.0965                                 | 18.5386                       |
| 30 ... 80 | ...                                                            | ...     | 334.4604                         | ...                                     | ...                           |
| 20 ... 80 | ...                                                            | ...     | 343.1749                         | ...                                     | ...                           |

An inspection of the fifth and sixth columns of the above Table will afford the most conclusive evidence of the increased ratio of Sickness above that set forth in previous Tables. To those interested in the progress of friendly societies the results are highly important, as they will demonstrate the impossibility of permanence in those institutions on their present foundations. Considering the immense number of those societies which have broken down, it is lamentable to think that so little should have been done to ascertain the real nature and extent of the risks to which they are subject. It is still more remarkable that so many legislative enactments should have occupied the attention of the Government of the country from time to time, and that Committees also of the House of Commons should have had the condition of those societies for several years under con-

sideration, without any practical measure being carried out for collecting and arranging data in a proper shape to point out the true character of the liabilities to which they are subject\*. In fact, the encouragement given to the formation of those societies by some recent Acts of Parliament should be regarded as an evil rather than as a benefit to the working classes. An immense number of societies were formed in a very short period, and their contributions regulated by the most delusive and inadequate data, so that at the present time very few are to be found calculated to survive many years. Under a scientific and amply developed system, those societies would be enabled, at no distant period, completely to remove the cause of nearly all that poverty, distress, and misery, which haunt our manufacturing towns, and fill our workhouses with the working classes of the country; but owing to the imperfect and unstable foundation on which they are at present built, instead of being a help and a support to a poor man, they involve him in those difficulties for which he might otherwise have provided. On becoming a member of such a society, he reasonably looks forward to it as a support for his declining years, and a protection during periods of sickness and disease; but ultimately, at the very time when assistance is required, he discovers that the society has been formed on a ruinous plan, that the increasing years and infirmities of its members have absorbed all its funds, and that those surviving must be thrown destitute on the parish as a public charity. To this, by the most ill conceived of all proceedings, the legislation of the Government has hitherto tended. Every facility and encouragement are given to the formation of societies, without any help or information for their management or guidance. The ship is cast upon the waves without rudder or compass, and the safety of the vessel left to accident and chance.

As stated, a Committee of the House of Commons in 1825, reported unfavourably of the table of sickness furnished in the preceding year by the Highland Society; still no other data were supplied on which any more confidence could be placed: the consequence was, that societies were formed, and continued to be managed, on calculations resulting from the same data; and, even up to the present time, thousands of those Societies are conducted either on those terms, or terms still less adequate to carry out the purposes contemplated.

An inspection of Column 4 of the preceding Table will shew that, in the decennial periods of life for 20-70, the friendly societies in England and Wales experience an excess of sickness of from 32 to 37 per cent. above that indicated in the Table of the Highland Society, or an average increase of sickness over the whole of that period of fifty years of 36.096 per cent.; or, in other words, friendly societies actually experience about one hundred and thirty-eight weeks' sickness in fifty years, while the Highland Society Table would lead them to expect eighty-eight weeks only.

\* Since these remarks were written, in the year 1845, a Return of the Sickness and Mortality experienced by Friendly Societies, during the quinquennium ending the 31st of December, 1851, has been printed by the order of the House of Commons.—See Parliamentary Paper of 1853, No. 955, also that of 1854, No. 506.

The ruin of any society, under such conditions, is inevitable. There are many other errors in the rules of friendly societies, connected with the various benefits which they promise, calculated to ruin their schemes; but if it were necessary here to cite instances in which societies have suffered from the simple feature of excessive sickness, abundant instances could be pointed out; and the internal evidence contained in this paper, of the actual rate of sickness experienced by societies in the aggregate, must also prove that individual societies have been sufferers. In illustration of this point, it is impossible to avoid quoting a passage from a very able report, dated 8th of February, 1841, submitted to the Edinburgh Compositors' Society, by a committee appointed to revise the laws. They state, in their report, that the contributions and benefits of the society were regulated by the data of the Highland Society; and, in order to discover whether the experience of the society had harmonised with the original data from which their calculations resulted, an investigation of the actual sickness in the society was made, of which the following is an Abstract:—

| Age.       | Number of Members. | Actual Sickness in the Society. |       | Amount of Sickness Expected by the Highland Society Tables. |       | Excess of Actual Sickness. |       |
|------------|--------------------|---------------------------------|-------|-------------------------------------------------------------|-------|----------------------------|-------|
|            |                    | Weeks.                          | Days. | Weeks.                                                      | Days. | Weeks.                     | Days. |
| 20 to 30   | 732                | 979                             | 1     | 417                                                         | 0     | 562                        | 1     |
| 30 ... 40  | 580                | 863                             | 5     | 398                                                         | 1     | 465                        | 4     |
| 40 ... 50  | 126                | 191                             | 5     | 129                                                         | 3     | 62                         | 2     |
| 50 ... 60  | 11                 | 12                              | 2     | 20                                                          | 4     | —8                         | 2     |
| Total..... | 1449               | 2047                            | 1     | 965                                                         | 2     | 1081                       | 5     |

It will thus be seen that the actual sickness experienced by this society has exceeded that contemplated by the Highland Society Tables by no less an amount than 112 per cent.

The following gives the amount of sickness as experienced by this society, and also according to the results of various Tables.

|                                                         | Weeks. | Days. | Excess of Sickness in Compositors' Society, Weeks. Days. |     |
|---------------------------------------------------------|--------|-------|----------------------------------------------------------|-----|
| Amount of Sickness in Compositors' Society              | 2047   | 1     | ...                                                      | ... |
| Ditto, Highland Society Tables                          | 965    | 2     | 1081                                                     | 5   |
| Ditto, Ansell's Table                                   | 1357   | 0     | 690                                                      | 1   |
| Results as given in this Paper, City Districts, Table V | 1748   | 0     | 299                                                      | 1   |
| Results as developed in { Printers                      | 2000   | 0     | 47                                                       | 1   |
| { Colliers and Miners                                   | 2146   | 0     | —98                                                      | 5   |

or ninety-eight weeks and five days less Sickness in the Compositors' Society than among Colliers and Miners.

It will thus appear, that while there was in the society an excess of 112 per cent. above the Highland Society's Table, and also an excess of 51 per cent. above Mr. Ansell's Table, there is an excess of only 17 per cent. above the results obtained in the present inquiry, for the average of all trades in the City Districts, and of 2 per cent. above the general class Printers, which includes both Compositors and Pressmen; but there is at the same time also actually less sickness than among Colliers and Miners by nearly 5 per cent.

It has been shewn that particular trades and employments are subject to different degrees of sickness and mortality, and the importance of this element in considering the health of towns, and the influence of locality on the duration of life, has already been pointed out; but in viewing the condition of friendly societies, the necessity of considering the peculiar effect of certain trades and occupations must appear to be of vital importance. A most remarkable disparity exists between the rates of sickness prevalent in different places and in different employments, and societies may run the greatest hazard by incautiously adopting each other's regulations or tables; for so great is the distinction which obtains between the liabilities incurred from members of different trades, that what would be sufficiently safe for one society might completely ruin another. It may seem to some that the excessive amount of sickness experienced by the Compositor's Society may be accounted for by the fluctuation in small numbers, but on reference to the report itself such will not be found to be the case. The facts extend over a term of sixteen years, and the results for the various periods are pretty uniform, and cannot be looked upon as the result of any accident, but must be regarded as a distinctive and proper feature of that trade to which the members of the society belong.

In calculating Tables for the guidance of such a society, it would evidently not be safe to assume the results for the general average of the Country or a given District as a sufficient basis to proceed upon; for, allowing such to be the case, and adopting even the present results as a standard of calculation, there would still be 17 per cent. of the sickness in the above society unprovided for. The remark in respect to the rates of mortality in different trades and occupations, is also true of sickness: the present inquiry cannot therefore be regarded as complete till the results for the various employments are published.

Other societies in Edinburgh, it will be seen from a following quotation from the report in question, have also experienced an increased amount of sickness beyond the rates of the Highland Society's Table, although the sickness in those societies has not equalled in amount that of the Compositors' Society. It is stated that the sickness in those societies amounted "on an average to no less than 87 per cent. more than the Highland Society's rate." Considering this statement, from the accuracy of detail in other parts of the same report, to be correct, it seems to be a very remarkable coincidence, that in the City Districts, being that with which those societies should be brought into comparison, there is, according to the results of this investigation, at the same term of life also exactly 87

per cent. more sickness than that given in the Highland Society's Table. From 20 to 60 years of age, according to the Highland Society's Table, (see page 415,) there is forty weeks' sickness to each person; but according to the City Districts, Table V, there is seventy-five weeks' sickness, or 87 per cent. more than given in the Highland Society's Table.

The practical advantage of thus recognising particular districts and occupations is obvious; for had either of the preceding questions been tested by the results for the general average, no satisfactory solution could have been offered. Hence the reason why some friendly societies go on prospering, while others, under apparently the same management and scheme, survive but for a short term of years, ultimately to involve their members in ruin when most in need of support. The following Extract from the Report of the Committee in question is important:—

“ The average annual sickness to an individual is as follows :—

|                             |     |     |   |   |   | Compositors' Society. |       |        | Highland Society. |       |        |
|-----------------------------|-----|-----|---|---|---|-----------------------|-------|--------|-------------------|-------|--------|
|                             |     |     |   |   |   | Weeks.                | Days. | Hours. | Weeks.            | Days. | Hours. |
| From 20 to 30 years of age, | .   | .   | . | . | . | 1                     | 2     | 1      | 0                 | 4     | 3      |
| ... 30 ... 40 ...           | ... | ... | . | . | . | 1                     | 2     | 22     | 0                 | 4     | 19     |
| ... 40 ... 50 ...           | ... | ... | . | . | . | 1                     | 3     | 3      | 1                 | 0     | 4      |
| ... 50 ... 60 ...           | ... | ... | . | . | . | 1                     | 0     | 17     | 1                 | 6     | 3      |

“ From a comparison of these two rates, it will be seen that the sickness experienced by this society has been more than double that given by the Highland Society. Since ascertaining this result, the Committee have made various inquiries in order to ascertain how far this increase corresponded with the experience of other societies established on similar principles; and they have to report, as the result of these inquiries, that in Heriot's Benefit Society, the School of Arts, the Goldsmiths' Equitable, the Journeymen Goldsmiths', and in the Cabinet and Chairmakers' Societies, a very great increase had also been experienced, amounting, on an average of these societies, to no less than 87 per cent. more than the Highland Society's rate. Great, however, as this increase appears, it is easy to be accounted for when the state of societies is considered during the period embraced by the Highland Society's inquiry. It is well known that up to the period of the publication of the Highland Society's Report, societies generally partook very much of a charitable character, no member being entitled to benefits unless he was in indigent circumstances. Now, when it is considered that the Highland Society's rate of sickness was deduced from the amount of sickness experienced by the 79 societies above mentioned, during a period when they were formed upon this charitable principle, it is not to be wondered at that now, when they are established upon strictly self-supporting insurance principles, and when, in consequence, each member claims the utmost extent of the benefits, the sickness should be found to be so much greater than was at first

supposed. This, the Committee conceive, is quite sufficient to account for the great disparity between the rate of sickness given by the Highland Society, and that now found to occur among societies."

The preceding comparisons did not extend beyond 60 years of age; but, as will appear from subsequent illustrations to be given in this paper, the claims to be made by members after passing their sixtieth year become generally so alarming, as to be the usual means of awakening societies to the danger of their position. For example, although in the Compositors' Society all the members were under 60 years of age, still there was a large amount of what is called permanent sickness. At page 6 of the Report in question, it will be seen that of the members actually sick,

|                |     |                          |
|----------------|-----|--------------------------|
| 91.0 per cent. | had | 7½ weeks' sickness each; |
| 3.5            | ... | 69                       |
| And 5.5        | ... | 246                      |

It will thus appear, that the amount of sickness among 5.5 per cent. of the members was actually more than double that experienced by another class of the same society by 91 per cent. When the subject of permanent sickness is brought forward, its relation to age, its effect on the funds of a society, and the methods by which the future liabilities of a society may be determined, will be amply discussed.

Having entered so fully into the characteristic features of the Highland Society's Table, in relation to the results of this inquiry, a simple inspection of the Table at page 415, will be sufficient to shew to what extent Mr. Ansell's Table is liable to the same objections. At the decennial periods of life, from 30-70, it will be seen that there is an excess of sickness in the friendly societies in England and Wales over Mr. Ansell's Table, varying from 4 to 24 per cent., or a mean difference over the whole of that period of forty years of 19.283 per cent. This excess of sickness, as well as all the other results in page 415, are derived from making Table V the standard of comparison; but if Mr. Ansell's Table were taken as the standard of comparison, the deficiency in sickness over that period of years would be 23 instead of 19 per cent., and at ages 60-70 the deficiency would be 31 instead of 24 per cent., as given at page 415, or a deficiency of nearly one-third. But the inadequacy of his Table as a general guide for friendly societies, will instantly appear by making it bear on the results of Table V for the City Districts, in which, as already stated, the amount of sickness from 21-60 years of age is seventy-five weeks, being an excess over Mr. Ansell's Table, for that period of life, of no less than 41 per cent. The greatest care and discrimination should therefore be exercised, in established friendly societies, not to adopt general results for the guidance of particular classes. The laws of sickness and mortality are under peculiar modifications in each class, and must be developed before any safe practical conclusions can be arrived at, deserving of public confidence.

In connection with the preceding remarks, Odd Fellows will naturally inquire whether the same observations are equally applicable to their own Order or Institution. An analysis has been made of the return issued in October 1845, by the Board of Directors at Manchester; and among other important information, there is given the amount of sickness and mortality in the various districts of the Unity during the year 1844. An inspection of the results of this analysis is highly calculated to inspire confidence in the preceding observations, and to shew that the rate of sickness there developed is strictly applicable for the guidance of the Order. As the return by the Board of Directors extends over 3682 lodges, and about one quarter of a million of members, great care has been bestowed on the reduction of the analysis presented in the various parts of this paper, in order that it may be safely relied on as a standard for future reference.

The average age of the members in the Manchester Unity is stated by the Board of Directors to be 32 years, and the gross amount of sickness experienced by 243,122 members, being the average number during the year 1844, was 226,917 weeks, or  $\cdot 933$  weeks to each member. On referring to Table V, p. 409 *ante*, it will be found that at age 32 the average sickness per annum is  $\cdot 9250$  weeks,—or, when the necessary correction for the maximum ages is applied in the former case, producing, in both instances, 6 days 11 hours to each member, yearly. It must, therefore, be very gratifying to every one interested in the progress of Benefit Associations for the working and middle classes, to find, that the amount of sickness among the members of those clubs, however variously constituted, shews so near an agreement, and effects almost a perfect realisation of a permanent law of sickness.

Again: as to the mortality experienced by the Order, the same conformity to the results given in these Contributions will be found to manifest itself. Every previous investigation into the laws of mortality produced the conviction, that the lives of the working classes of the country were of shorter duration than those of the upper classes, and also of less value than the average results for the whole kingdom: but here we have a confirmation of the fact, that the industrious workmen of the country experience an increased duration of life.

At age 32, the mortality of males for the whole of England and Wales is one in 95; the mortality in the Manchester Unity is one in 106; and, according to the results as given in this paper, for all classes in friendly societies at age 32, the mortality is one in 128. To illustrate further this point of the inquiry, the following Abstract will be useful, being an analysis of the actual results in the Manchester Unity of Odd Fellows for the year 1844.

In explanation of this Table, it may be stated that the Rural District is composed of those places the population of which is under 5000, the Town District of those places the population of which is 5000 and under 30,000, and the City District of such places as have a population of 30,000 and upwards.

TABLE Y.

| District.      | Average No. of Members during 1844. | Deaths of Members. | Death of Members' Wives. | No. of Week's Sickness. | No. of Members out of which |                         | Average Sickness yearly to each Member expressed in Weeks. |
|----------------|-------------------------------------|--------------------|--------------------------|-------------------------|-----------------------------|-------------------------|------------------------------------------------------------|
|                |                                     |                    |                          |                         | One Member died.            | One Member's Wife died. |                                                            |
| Rural . . . .  | 66208                               | 608                | 434                      | 57795                   | 108.89                      | 152.55                  | 0.873                                                      |
| Town . . . .   | 77070                               | 700                | 554                      | 70435                   | 110.10                      | 139.01                  | 0.913                                                      |
| City . . . .   | 99848                               | 978                | 662                      | 98687                   | 102.09                      | 150.83                  | 0.988                                                      |
| Whole Unity* . | 243126                              | 2286               | 1650                     | 226917                  | 106.35                      | 147.34                  | 0.933                                                      |

During the year 1844, it will be seen that the mortality for the whole Unity was, as already stated, about one to every 106 members ; while for the Rural districts it was one in 109, for the Town districts it was one in 110, and for the City districts it was one in 102.

The average amount of sickness to each member during the same year was, for the—

Rural Districts . . . . 0.873 weeks, or 6 days, 3 hours.

Town Districts . . . . 0.913 ... 6 ... 9 ...

City Districts . . . . 0.988 ... 6 ... 22 ...

Whole Unity . . . . 0.933 .. 6 ... 13 ...

But according to the results in these "Contributions," already adverted to, the average amount of sickness for the same districts would be—

Rural Districts . . . . 0.863 weeks, or 6 days 1 hour.

Town Districts . . . . 0.929 ... 6 ... 12 ...

City Districts . . . . 1.148 ... 8 ... 1 ...

Three Districts combined . 0.925 ... 6 ... 11 ...

In instituting the above comparison, it should be kept in view that the actual ages of all the members in the Unity during that year are unknown ; but as the Directors, in their Report, have stated the average age to be 32, that age has been taken as the point of comparison. For refined purposes, objections can be brought against this step, but for the present illustration it is sufficiently correct.

Considering that the above results from the experience of the Order relate to one year only, it is the more remarkable to find them approximate so closely to the results given in the preceding portion of these Contributions from facts extending over several years.

It is evident, then, that the Manchester Unity of Odd Fellows is subject to as much sickness and mortality as that shewn in this paper. The evidence thus derived from the

\* In the original Report issued by the Board of Directors, several errors occurred in the figures, but the above results are correct.

working of the Order itself, should be a sufficient answer to those who have hitherto argued that the favourable circumstances in which the members were placed, exposed them to less hazard than the members of ordinary friendly societies. The facts of the case, it will be seen, do not support the supposition. It is, therefore, obvious that rates of contribution less favourable than those set forth in the Tables here given, would be unsafe for the guidance of the Order.

Since these remarks were written, the question as to "Whether the experience of other friendly societies in regard to sickness was fairly applicable to Odd Fellow Societies," has undergone much discussion, and assumed a public interest.

The investigation, evidence, and reports published by Lord Beaumont's Committee of the House of Lords on Provident Associations, Sessions 1847-8, paper No. 126: and by Mr. Sotheron's Committee of the Commons, in the Session 1849, paper No. 548, also seem to be chiefly directed to the same question, namely, whether the data published by Mr. Ansell as well as the data in "Contributions to Vital Statistics," but more particularly the latter, were applicable to the purposes of Friendly and Odd Fellow Societies. By the witnesses examined before these Committees on behalf of the Odd Fellows, every species of evidence seems to have been urged to make it appear that the members of such clubs were not so liable to sickness as the members of friendly societies generally throughout the country; and the results of the publication by Mr. Ratcliffe, in the year 1850, acquire, in consequence, an additional interest: as they exhibit the actual experience of the Order, deduced from carefully conducted observations on the experience of the whole of the members during the three years of 1846-8; and they are valuable as testing the speculative opinions of the different witnesses examined by the Committee.

In the concluding portions of the earlier editions of the present treatise, published in 1845, we find the following remarks:—

One of the most efficient means of awakening attention to the perilous condition of the Order would be the publication of well digested records of the experience of the various lodges, from the most remote periods of which their books admit; and a proper and skilful analysis of these extensively circulated, could not fail to give birth to much useful conversation and debate, ultimately resulting in important and highly beneficial reforms. Science would also be greatly aided by the facts and testimony of such records, and the literature of the Order acquire an importance in the community not otherwise easily attainable. The expense to each lodge of contributing its experience would be very trifling, while the advantages to the Unity would be immense.

It appears that Odd Fellows have acted on this advice; or, at all events, have followed in the precise course prescribed; for Mr. Ratcliffe, in his Report on the sickness experienced by the Order during the year 1848, says—

The Bristol A. M. C. having empowered the Directors to issue return-sheets, to be filled up by each lodge, containing the initials, trade, and age of every member; and the amount of sickness and deaths

occurring during the year ; and such resolution having been repeated at the Oxford and Southampton A. M. C.'s, the Directors, in accordance therewith, sent return-sheets to every district, to be by them forwarded to lodges, and the same have been duly completed and returned back to them, and form the first means ever taken by the Manchester Unity to ascertain the amount of sickness and mortality experienced by the Order. In going through such returns, I am of opinion that every attention has been paid to forward them as correct as possible ; and having an opportunity, when calling upon Districts to fill up the returns for the lists of lodges, to call upon them to give me the age and number of deaths that had occurred during the same year, I availed myself of that opportunity of doing so, and these returns having been collected from different and independent sources, and perfectly agreeing with the returns received from lodges, is a sufficient proof, if any was required, of the correctness of such returns.

The following gives a succinct view of the data from which results in these Contributions, and also those of the Odd Fellow Societies are derived :—

TABLE Z.

| Age.      | SICKNESS FOR QUINQUENNIAL TERMS OF LIFE ACCORDING TO                          |            |                                |                    |            |                                | Age.      |

| 71 ... 75 | 11420                                                                         | 210195·995 | 18·4056                        | 206                | 2790·567   | 13·5464                        | 71 ... 75 |
| 76 ... 80 | 5626                                                                          | 146594·853 | 26·0566                        | 63                 | 1041·708   | 16·5349                        | 76 ... 80 |
| 81 ... 85 | 2002                                                                          | 56589·711  | 28·2665                        | 24                 | 600·855    | 25·0356                        | 81 ... 85 |

It will be observed in the above figures that the rate of sickness at the earlier and more advanced periods of life is less, according to the experience of Odd Fellow Societies ; in the middle period of life the difference is very little ; and in the ten years, 56–65, the rate of sickness is higher than that given in these Contributions : and in reference to the differences existing between the two classes of results at the younger and older ages, there is a sufficient explanation to shew that they are due to accidental causes, and do not constitute any essential feature of difference depending on physical or social conditions peculiar to either class of results. An inspection of column 5 preceding, will shew that in the data connected with the Odd Fellow experience the numbers under observation after

the age of 65, are much too limited to admit of any results derived therefrom being safely relied on. In the term of life 66-70, the whole experience is confined to 700 years of life, or observations on about 233 members for a term of three years. Again, in the next quinquennium, the experience is limited to about 69 members only for the same period; and in the decennial term following, the whole experience does not embrace more than about 29 members—numbers obviously so small that it is impossible to place any reliance on the results. On the other hand, the data from which the results of these Contributions are derived for the corresponding terms of life are upwards of forty times the magnitude. It is therefore very much to be regretted that Mr. Ratcliffe should have allowed so very inadequate data to enter into any of the monetary Tables representing the contributions to provide sickness for the whole of life; or should have employed his data even beyond the age of 65, as the monetary expressions are those most likely to be questioned and reasoned upon by the members, who may thereby be led into serious errors. Beyond the age of 65, Mr. Ansell's data included only 373 years of life; but he did not carry his monetary Tables above the age of 70, and even up to that age he adopted sufficient means of correcting any irregularities likely to arise from the limited numbers immediately preceding that period of life.

There is another feature in the Odd Fellow results for ages under 35 or 40, which requires observation. The Manchester Unity of Odd Fellows, is under its present gigantic numbers, of but recent and of most rapid growth. In the year 1834, the number of members was about 60,000, and in the beginning of the year 1846, the time to which the data now collected relates, the number of members was 251,727, being an increase during the twelve years of about 19,000 yearly; but in consequence of the dismissions from the Unity, the number of new members has been much greater. The Directors say, in one of their Reports, that "The amount of initiation money which was received from members in 1844, being no less a sum than £49,382, it will be discovered, on reference to the list of lodges, that our increase of members in that year was only 21,461, and by these returns it is clearly proved that upwards of 40,000 members were initiated in 1844; thereby at once affirming, that upwards of 20,000 members left the Order in one year." Keeping in view, therefore, the immense influx of young members into the Unity, with the fact that the great bulk of them is under the age of 35, the average age of all the members being at the period to which the data in Table VII relates, about 33 years, it is obvious that at the younger ages, so long as such a mutation in the list of the members goes on, there must be recorded in the books of the society, and markedly so at the younger ages, a much less amount of sickness than the very same persons would be subject to under the usual quiet and permanence of the members of friendly societies in general. This remarkable fluctuation in the body of members of the Order, occasioned by the very extraordinary number of withdrawals, and the still more extraordinary augmentation of the numbers again by the admission of new members, although

greatly to be regretted, as depriving the Institution of what, under happier circumstances, would be its greatest recommendation, that of cultivating among its members settled habits of prudence and forethought, is, nevertheless, so long as such disturbing causes exist, calculated to reduce its liabilities very materially, and especially, recruiting the ranks with healthy and vigorous members, at the younger ages, will shew at these terms of life, a diminished ratio of sickness. However, after the age of 35 or 40, the effect of this selection or influence will not be so visible, if it does not entirely disappear. A striking illustration of this is observable, by comparing the results of the Odd Fellows, and of the data in these Contributions between the ages of 40 and 65, in which the coincidences of the two rates of sickness is certainly remarkable, considering the very different sources of the data, and the different circumstances under which they were collected.

TABLE AA.

| From Age. | Amount of Sickness experienced in passing through the following terms of life, expressed in weeks, according to the results of |                                      |                      |
|-----------|--------------------------------------------------------------------------------------------------------------------------------|--------------------------------------|----------------------|
|           | The "Unity."                                                                                                                   | "Contributions to Vital Statistics." | Difference per Cent. |
| 60 to 65  | 27·2239                                                                                                                        | 27·0894                              | — 0·49               |
| 50 ... 60 | 26·1073                                                                                                                        | 26·6338                              | + 1·97               |
| 50 ... 65 | 53·3312                                                                                                                        | 53·7232                              | + 0·72               |
| 45 ... 65 | 61·1277                                                                                                                        | 62·0334                              | + 1·46               |
| 40 ... 65 | 67·0746                                                                                                                        | 68·5131                              | + 2·08               |

The preceding Table will suffice to convey a general idea of the results now given to the public by Mr. Ratcliffe, and their relation to those of preceding inquiries. In his interesting volume there are many subjects of importance treated, but there is only space for a very few further remarks, connected with sickness peculiar to different occupations. The results are given for 26 different trades, but the number under observation in the majority of groups is so small, that it is surprising Mr. Ratcliffe should have thought so limited data of importance enough to induce him to calculate an independent series of results for each. The following are the only groups of sufficient magnitude to deserve attention:—

| Occupation.                            | Aggregate amount of sickness experienced in passing through the following periods of life. |                    |
|----------------------------------------|--------------------------------------------------------------------------------------------|--------------------|
|                                        | From Age 30 to 40.                                                                         | From Age 40 to 50. |
| Blacksmiths . . . . .                  | 8·5676                                                                                     | 13·2624            |
| Bricklayers, Plasterers, and Slaters . | 8·8554                                                                                     | 12·8471            |
| Carpenters . . . . .                   | 9·0781                                                                                     | 10·8080            |
| Agricultural Labourers . . . . .       | 10·1360                                                                                    | 14·1457            |
| Town and City Labourers . . . . .      | 10·7897                                                                                    | 14·9163            |
| Mill Operatives . . . . .              | 7·2435                                                                                     | 12·0533            |
| Miners . . . . .                       | 15·6215                                                                                    | 25·5730            |
| Plumbers, Painters, and Glaziers . .   | 8·6707                                                                                     | 17·7194            |
| Servants . . . . .                     | 7·5761                                                                                     | 10·4663            |
| Shoemakers . . . . .                   | 8·0200                                                                                     | 12·0715            |
| Spinners . . . . .                     | 9·4789                                                                                     | 18·4460            |
| Stonemasons . . . . .                  | 11·2959                                                                                    | 16·4316            |
| Tailors . . . . .                      | 9·6825                                                                                     | 12·0638            |
| Weavers . . . . .                      | 10·5768                                                                                    | 13·9304            |

The preceding figures are sufficient to shew the remarkable influence of particular occupations on the amount of sickness; but the difference shewn by the above results is evidently, to some extent due to the fluctuation of small numbers, and cannot be taken as a true criterion of the sanitary condition of the different trades. Still, there can be no doubt but that occupation is a most important element, and should be kept closely in view by those connected with the formation and management of friendly societies. The neglect of this important consideration in the establishment of these provident associations, and the application of average results only, has frequently been the cause of their ruin.

Mr. Ratcliffe, at page 36 of his publication, has the following important remark on this subject. "It must be apparent that these lives will be existing under very different circumstances, and be affected by a different combination of trades. Mr. Neison's agricultural labourers form 33 per cent., and in the experience here given they form only 20 per cent. of the rural class; and if a larger per centage of similar trades, experiencing more than the average sickness, be combined in one more than in the other class, there will appear more average sickness existing in the first than in the other class, from not having that large per centage of those trades,—other circumstances being similar." Also, "in addition to being affected by a different combination of trades, the average sickness will vary according to locality. The persons resident in Glasgow and Liverpool, for example, experience such an average amount of sickness that, by being included in the City Districts, the bulk shews an excess of aggregate sickness (between the ages of 20–70) of 9·4416 weeks over the same class of Mr. Neison's; but, by being abstracted, the remaining portion shews a much less aggregate sickness than the one just named."

These observations prove how very needful it is to be careful in drawing conclusions from isolated observations; and that on nothing but extended experience, carefully analysed with a strict regard to all the circumstances connected with the data, can any reliance be placed. The results now submitted to the public as the experience of the "Manchester Unity of the Independent Order of Odd Fellows," can only as yet be regarded as an approximation to what, under a more settled and permanent state of the Institution, will be the average rate of sickness; and it would be only prudent for the directors and others taking an active part in its affairs, not to discard other data, but to regard their own more as an indication of the features peculiar to themselves, than as an ample and satisfactory body of facts by which they should be implicitly guided.

From the results now presented in connection with the working of the Order itself, it is plain that there exists no better foundation on which the members can base their calculations than the data and facts given in these Contributions; as the practical experience of the Unity is not only a confirmation of the laws of sickness and mortality herein developed, but almost an actual assimilation with them, and, so far as practical legislation is concerned, one might be used for the other. Admitting this, it will hence

follow, that the money tests hereafter given and derived from the data in these Contributions are equally applicable to the guidance of the Order of Odd Fellows; and any one objecting to a proposition to establish the Institution on a rate of contributions equivalent to the results of those data, must carry his objections much further, and object to the data themselves; but as it has been shewn that to object to the data would be to deny the experience of the Order, no such objections can be raised, and therefore the money tests and values to be hereafter presented will remain indisputable.

Another element to be kept in view while considering this question, is the influence of time in producing an average result. It might happen that a particular society or district may experience a reduced or an increased amount of sickness in a particular year; but were the observations extended over several years, the deficiency of one would be compensated by the excess of another year. More striking illustrations of this can be shewn in connection with the law of mortality. Even very large populations, such as the population of Glasgow, are subject to remarkable fluctuations, shewing an extreme difference in some years of about 68 per cent., or a mean fluctuation of about 32 per cent. An inspection of the total male deaths for all ages, for each of the ten years 1832-41 will render this evident.

|                         |      |                         |      |
|-------------------------|------|-------------------------|------|
| Total Deaths in 1832... | 4811 | Total Deaths in 1837... | 5423 |
| ... 1833...             | 3229 | ... 1838...             | 3490 |
| ... 1834...             | 3255 | ... 1839...             | 3898 |
| ... 1835...             | 3726 | ... 1840...             | 4470 |
| ... 1836...             | 4334 | ... 1841...             | 4514 |

It will further be seen, that those remarkable fluctuations are due chiefly to the mortality in mature life, and not to the mortality in infancy, as some writers have believed.

It appears, then, that while the extreme difference in the mortality from ages 20 to 50 is 125 per cent., for the first year of life it is only 32 per cent. If the mean fluctuation for ages 20 to 50 be taken, it will be found to be 53 per cent., while that for the first year of life is only 14 per cent. Were the inspection extended to the mortality of female life, similar results would be obtained. Notwithstanding the inferior numbers in infant life, the fluctuation is confined within narrower limits than the mortality of mature life; and this fact is in accordance with the doctrine of probability when applied to any other subject,

as well as to the mortality of life. For whenever the intensity which determines any result increases—or in other words, when the probability of any event approaches unity—so also will the fluctuation in a series of events be reduced in amount.

The folly of relying on limited observations for the guidance of any individual society or lodge, may be further proved by referring to pp. 417–20 *ante*, as well as from further illustrations to be hereafter given, in which it is shewn that the sickness in some trades differs widely; and when numbers are small, there must, of necessity, be also peculiarity of employment, and consequently a peculiar series of results. The same principle is disclosed by the facts set forth in the Abstract at p. 426 preceding, and in Appendix A of the Report by Lord Beaumont's Committee, Session 1847–8, Paper No. 126, which should be most carefully studied by those connected with the practical management of friendly societies. The following facts are also curious, and deserve the closest attention. In a Report made by Mr. Yeats in 1847, on the affairs of a friendly society in Aberdeen, the following statements are found:—

| Age.      | Number of Free Members on the Fund, from Oct. 1832, to Oct. 1846. | Years of Life during which the Society was liable for Sickness Allowances. | Amount of Sickness expected for the time during which the Society was liable. | Amount of Sickness actually experienced. (Seven days per week.) |

| Totals .  | 400                                                               | 944 3                                                                      | 842·317                                                                       | 1066 1                                                          |

“ From the above it will be seen, that the actual experience of sickness has considerably exceeded the expected amount. The excess is 20·994 per cent.”

“ The excess of the actual experience of the society, above the Table in the Highland Society's Report, is 36·795 per cent.; the total amount of sickness according to which would have been only 673·854 weeks.”

“ The latest published Table of the Rate of Sickness in Scotland is that contained in ‘Contributions to Vital Statistics,’ by F. G. P. Neison, Table V. The amount of sickness, according to that Table, would have been 885·202 weeks, so that the experience of the society exceeds that in Neison's Table by 16·034 per cent.”

“ The experience of the society is indeed on a limited basis, embracing only 400 members, who have collectively been exposed to the risk during 944 years of life, and no

certain conclusion can be drawn from it; but the fact of there being an excess so considerable in amount, taken in connection with the fact, that wherever accurate observations have been made, the same tendency has always been manifested, ought to lead to watchful care and caution."

"The following Table shews, (1), The average time in each period of five years during which each member was entitled to Sick Benefit; (2), The amount of sickness which he was expected to experience, according to the data on which the contributions were calculated; and, (3), The average amount of sickness actually experienced by the members during each period:—

TABLE BB.

| Age.      | Average No. Years of Life in each quinquennium during which the Society was liable to each member. | Average amount of sickness expected for each member during the preceding period. | Average amount of sickness to each member actually experienced during each period. |

In regard to sickness, the following shews the average ratio per annum to each member, according to the actual experience of the Aberdeen Society, the Thistle and Rose Society, and the average for friendly societies in England and Wales, Table E, pp. 26-27 *ante*.

TABLE DD.

| Age.      | Average Sickness yearly to each Member, expressed in weeks, according to the experience of the |                   |                                                   |
|-----------|------------------------------------------------------------------------------------------------|-------------------|---------------------------------------------------|
|           | Thistle and Rose Society.                                                                      | Aberdeen Society. | Friendly Societies in England and Wales. Table E. |
| 25 to 30  | ·2178                                                                                          | ·742              | ·9014                                             |
| 30 ... 35 | ·6850                                                                                          | 1·346             | ·9248                                             |
| 35 ... 40 | ·6467                                                                                          | ·879              | 1·0718                                            |
| 40 ... 45 | 1·1930                                                                                         | 2·337             | 1·3443                                            |
| 45 ... 50 | 1·9702                                                                                         | 2·233             | 1·7185                                            |
| 50 ... 55 | 1·7951                                                                                         | ·555              | 2·3231                                            |

It is hence obvious that, although the members of the Thistle and Rose Society are resident chiefly in the City of Glasgow, they are subject to a remarkably low rate of sickness, while, according to the results for the Aberdeen Society, the rate of sickness is even higher than that for England and Wales by 16 per cent. It will also be observed that there is a striking illustration in the Thistle and Rose Society of a high rate of mortality, and a very low rate of sickness, while in the friendly societies of England and Wales the sickness is much higher, and the mortality lower. If reference be now made to the facts given in Mr. Ratcliffe's analysis of the Odd Fellow Sickness, he will be found to state, at p. 36, that "In addition to being affected by a different combination of trades, the average sickness will vary according to locality; the persons resident in Glasgow and Liverpool, for example, experience such an average amount of sickness, that, by being included in the City Districts, the bulk shews an excess of aggregate sickness of 9·4416 weeks over the same class of Mr. Neison's, but, by being abstracted, the remaining portion shews a much less aggregate sickness than the one just named," but, at p. 135 of his work, the results of the sickness for the Odd Fellow Lodges in Glasgow are furnished, and in the following Abstract the amount of sickness will be found contrasted with the results for the Thistle and Rose Society in the above city:—

TABLE EE.

| Age.      | Amount of Sickness experienced in passing through the following periods of life, according to |                                    |                                                         |
|-----------|-----------------------------------------------------------------------------------------------|------------------------------------|---------------------------------------------------------|
|           | Odd Fellow Societies, Glasgow.                                                                | Thistle and Rose Society, Glasgow. | Excess per Cent. of Odd Fellow Society above the other. |
| 20 to 30  | 8·9107                                                                                        | 6·847                              | 30·140                                                  |
| 30 ... 40 | 14·3855                                                                                       | 6·421                              | 125·284                                                 |
| 40 ... 50 | 23·6009                                                                                       | 16·135                             | 46·272                                                  |
| 20 ... 50 | 46·8971                                                                                       | 29·403                             | 59·498                                                  |

The preceding results are certainly most curious, and cannot fail to occasion to those who seriously consider and study the subject, many important and interesting reflections on the state and condition of friendly societies. After a careful examination of the preceding facts, it will immediately appear to every intelligent observer, how very difficult must be the task of advising friendly societies and Odd Fellows lodges on the graduation of the scales to be adopted, under the peculiar circumstances of each lodge or society. It has always been a difficult matter to contend against the disposition which has long existed for the adoption of a uniform scale for all societies indiscriminately; even the two recent Committees of the Houses of Parliament have shewn a strong tendency in that direction, and nothing short of the production of the most striking examples of the failures and dangers of such a course could have prevented the adoption of model Tables, to be used as applicable under all circumstances. It is, however, now abundantly evident, that the circumstances under which different societies are placed, are of such a nature as to cause the most striking differences in their liabilities, and it is only a close and laborious study of the subject, which will qualify any one to give advice to the managers of them on the questions of most vital importance to their stability and permanency. The facts given by Mr. Ratcliffe for the Odd Fellows lodges in the City of Glasgow, do not extend beyond the age of 50, and, therefore, the comparison between them and the results of the Thistle and Rose Society, must be limited to that age; but so far as respects the rate of sickness in the Thistle and Rose Society itself, there is a curious circumstance, which it is important to describe for the benefit of those connected with the management of sick clubs, as proving how many causes affect the prosperity and liabilities of these societies, and how essential it is that all those elements should be well understood, before pronouncing on their state or condition. The following shews the amount of sickness experienced in passing through different periods of life, deduced from the actual experience of the society, from the year 1810 to 1848, contrasted with the results of friendly societies in England and Wales generally, as given in Table V, p. 409 *ante*.

TABLE FF.

| Age.      | Amount of Sickness experienced in passing through each period of life. |                           |                                                                   |
|-----------|------------------------------------------------------------------------|---------------------------|-------------------------------------------------------------------|
|           | England and Wales.                                                     | Thistle and Rose Society. | Difference of Sickness per Cent. in the Thistle and Rose Society. |
| 20 to 30  | 8.7145                                                                 | 6.8468                    | — 27.278                                                          |
| 25 ... 35 | 9.2123                                                                 | 7.9468                    | — 13.408                                                          |
| 30 ... 40 | 9.9120                                                                 | 6.4205                    | — 54.380                                                          |
| 35 ... 45 | 11.7519                                                                | 9.8710                    | — 19.055                                                          |
| 40 ... 50 | 14.7999                                                                | 16.1349                   | + 8.274                                                           |
| 45 ... 55 | 19.4607                                                                | 25.8203                   | + 24.630                                                          |
| 50 ... 60 | 27.0894                                                                | 41.7634                   | + 35.136                                                          |
| 55 ... 65 | 42.5727                                                                | 56.5032                   | + 24.654                                                          |
| 60 ... 70 | 77.3029                                                                | 107.0837                  | + 27.811                                                          |
| 20 ... 55 | 44.5769                                                                | 45.5842                   | + 2.210                                                           |
| 55 ... 70 | 93.2418                                                                | 132.6651                  | + 29.716                                                          |
| 20 ... 70 | 137.8187                                                               | 178.2493                  | + 22.682                                                          |

There is here a very remarkable feature disclosed in the rate of sickness by which the above society is influenced; in each term of life under 40, the rate is uniformly and very largely under that for England and Wales, but above that age the difference is in the opposite direction. The sickness between ages 20–40, in England and Wales, exceeds that of the Thistle and Rose Society by 40·4 per cent., but from ages 40–70 falls short of it by 28·2 per cent. Again, between ages 20–55 the aggregate sickness differs by 2·2 per cent., but in the 15 years 55–70, the excess of sickness in the Thistle and Rose Society is about 30 per cent., and over the whole term of fifty years 20–70 the excess of sickness is 22·682 per cent. Hence, although the aggregate sickness in this society exceeds that of the average of societies in England and Wales, it is obvious that rates or scales of contributions and benefits, graduated according to the data for the kingdom at large, would be quite unsuited for this society or for any other, subject to a like peculiarity in the law of sickness. The greatest care and judgment are therefore necessary to discriminate the nature and extent of the sickness to which societies are subject. General results can only be useful for general purposes, but may lead to the most disastrous consequences if applied indiscriminately to individual societies. In some documents recently received from Dr. Watt, of Glasgow, relative to this society, the following figures are found:—

“Amount of sickness experienced by the society from the 1st of December, 1830, to the 1st of December, 1848, among all the members, between the ages of 19–70, and embracing 4279·25 years of life, compared with the sickness which would have been experienced according to the rates of other Tables.”

|                                                                 |                |
|-----------------------------------------------------------------|----------------|
| “Actual experience of the Society . . . . .                     | = 7214 weeks.  |
| Mr. Neison’s (Rural, Town and City Districts—England) . . . . . | = 7398 weeks.  |
| Town Districts . . . . .                                        | = 7694 weeks.  |
| Mr. Ansell’s Tables . . . . .                                   | = 6000 weeks.  |
| Highland Society’s Tables . . . . .                             | = 4429 weeks.  |
| Dr. Price’s Hypothesis . . . . .                                | = 5959 weeks.” |

It has already been stated that the mortality in this society has been remarkably high, compared to the amount of sickness; and what is deserving of observation, is the fact, that while the sickness under the age of 40, is 40·4 per cent. under the ratio for England and Wales, still the mortality at the same term of life is upwards of 35 per cent. above that of England and Wales.

The following are the results of the mortality:—

|                                                              | From age 28-44. | From age 45-70. | Total. |
|--------------------------------------------------------------|-----------------|-----------------|--------|
| Actual experience of the society from 1830–48 . . . . .      | 42              | + 46            | = 88   |
| Expected Mortality according to Mr. Ansell’s Table . . . . . | 39              | + 39            | = 78   |
| ... Northampton do. . . . .                                  | 54              | + 45            | = 98   |
| ... Carlisle do. . . . .                                     | 31              | + 27            | = 58   |

The affairs of this society appear to be managed with great skill and judgment, and although it cannot, either in respect to the number of its members, or the amount of its funds, be considered of equal importance to many societies in England, there is no society south of the Tweed conducted with more intelligence, nor furnishing more useful and valuable annual reports, which appear to be quite models for imitation by other societies.

In 1848, a very interesting report was made by Mr. Ansell, on the state of a large friendly society, established in an agricultural county in the East of England. The history and circumstances connected with this society are remarkable, and calculated to throw considerable light on the causes which frequently lead to the dissolution of provident institutions, shewing in a striking manner the danger of estimating from average results the liabilities of individual societies, even when established on an extensive scale. The following letter, received from the secretary of the society in 1843, describes in a brief manner its history, as well as the writer's views on the liabilities of friendly societies, prior to the publication of "Contributions to Vital Statistics."

*Provident Society's Office, Chelmsford,*  
31st October, 1843.

SIR,

Remarking on the state of friendly societies—Enclosed I hand you a copy of the Rules, and the 25th Report of the Chelmsford and Essex Provident Society.

I had the honour of being associated with the Rev. R. G. Baker, at that time Curate of Springfield, but at present Rector of Fulham, in the establishment of this institution, and which I have conducted for more than a quarter of a century, during which time I have watched with no little care and anxiety its eventful progress.

When first contemplated, it was intended to limit it to Springfield, a rural parish, adjoining the Town of Chelmsford; this idea was abandoned, and it was finally determined that it should include a circle of four miles round the Shire Hall, making the Shire Hall the centre, or turning point.

Four years afterwards, the boundary was extended to seven miles round the Shire Hall, and, in the ninth year, the boundary wall was thrown down, and it now occupies the greater part of the county, having nineteen districts, besides the home district. It has between three and four hundred honorary members, and upwards of 5500 subscribing members, and a capital of £.25,000 nearly.

The business of the society was, however, conducted in Springfield more than twenty years, until it had fairly outgrown the accommodation there afforded. A more eligible situation offering itself, it was removed from Springfield into the town of Chelmsford.

I have not time to make any lengthened observations on the subject of friendly societies, but this much I venture to assert, that very little is known, or can be learnt of the actual rate of sickness experienced by members of friendly societies, because so very little attention has hitherto been paid to the subject.

Conducted as friendly societies mostly are, at a public house, where the business of the ill-paid clerk is to collect the monthly payments—to keep a sort of beer-score account thereof—to smoke his pipe,—drink his quart of beer,—lock up his book in the formidable box "with three locks and three

keys," until the following month, and then his labours end, without his giving the society's real interest a passing thought during the interval.

Then again the stewards, What are they? or what knowledge do they possess? Changed every three months, they know less, if possible, than the clerk: the office being generally filled by the poorer, and, consequently, more illiterate members, oftentimes not able to read their own names. This happens because they are chosen by *rotation*: the more intelligent members pay the fine rather than fill the office, consequently, the duties fall on the most incompetent.

Under these circumstances, and with such materials, it is no wonder that actuaries should come to wrong conclusions on the subject, and must do so until they have some data on which they can confidently rely.

So far as the County of Essex is concerned, I do not hesitate to say, that the calculations of the Highland Society are very much below the actual rate of sickness experienced by this society, and so are Mr. Ansell's;—I allude to sickness in early life.

There appears to me to be a great mistake in representing sickness, like a flight of steps, or Jacob's Ladder; judging from actual experience, I conclude that young persons have more sickness than actuaries give them credit for.

I have for eighteen years been engaged in collecting the experience of this society, as to the actual amount of sickness amongst the members of the different ages, and should I be spared to continue it for twelve years longer, I think it will make a good almanack for the County of Essex.

By making this new inquiry in Scotland\*, I presume that time has told the tale in that country, that the calculations of the Highland Society are too low.

A series of reports I am not able to furnish you with, I merely retain a copy for my own use.

I thank you for the papers sent; accept my best wishes for success in your present undertaking.

Yours, truly,

JOHN BASSINGWHITE.

To F. G. P. NEISON.

There can be no doubt that Mr. Bassingwhite has been a close observer of the progress of the society, and that, with one exception, his opinions may be regarded as founded on fact. The remarks about "Jacob's Ladder" only shew how very difficult it is for even those in the closest relations with the practical working or progress of a provident society, to judge with anything like accuracy of some of the most important elements of its liabilities; for, from the records of this same society, it will be found that sickness does actually increase in its intensity with the increase of age, following the law so well established by other results. But certainly, the amount of sickness experienced by the members is very high, and a consideration of the following results deduced from the report already referred to, is well calculated to shew, not only to Odd Fellows, but to friendly societies in general, the necessity of carefully viewing all the elements likely to affect their interests, and to prevent them from placing confidence in either isolated observations or aggregated general results:—

\* Alluding to the prizes offered by the Author for the best returns from friendly societies.

TABLE GG.

*Sickness experienced by the Male Members of the "Essex Provident Society,"  
from its foundation in 1818, till the year 1847.*

| 66 ... 70 | 32.00                                                                       | 510.999                                  | 15.969                            | 11.1279                                                                   | + 4.8411                                                            | + 43.50                 |
| 71 ... 72 | 2.50                                                                        | 21.286                                   | 8.514                             | ...                                                                       | ...                                                                 | ...                     |
| Total . . | 45537.25                                                                    | 69353.499                                | 1.501                             | ...                                                                       | ...                                                                 | ...                     |

From the preceding letter it will be observed that in 1843 the society had 5500 subscribing members; but at the period at which the above observations close, there were 6146 members, while the gross number of years of life to which members were exposed to the risk of sickness was no less than 45537.25 years, consequently, as the data have been collected from the experience of twenty years, the results may be considered to fairly represent the liabilities of any friendly society, the members of which are similarly circumstanced to those in the Rural Districts of Essex. The rate of sickness, it will be seen, exceeds that of friendly societies generally in England and Wales, by upwards of 40 per cent. If, therefore, in constructing Tables for such a society, or in estimating its liabilities, an actuary were to be guided by the rate for the whole kingdom, or for any one of the districts set forth in these Contributions, or in the similar districts of the Odd Fellow results recently published by the Unity, it is obvious that a most fatal error would be committed. The greatest care and judgment are consequently required, both in establishing friendly societies, and in remodelling existing ones, to ascertain the precise rate of sickness peculiar to the circumstances of the case, as nothing could be more fallacious and contrary to all experience and correct observation, than the application of a general rate of sickness indiscriminately to all societies. It is therefore to be lamented that in the present advanced state of the laws of sickness, some authorities should still, without distinction, issue to societies who may apply to them for advice, the same stereotyped set of printed Tables, whatever may be the circumstances in which they are placed.

As already stated, Appendix A of Lord Beaumont's Committee, Session 1847-8, paper No. 126, will be found to contain some remarkable examples of the different rates of

sickness to which societies are subject, but an interesting contrast to the results of the Essex Provident Society will be found in the experience of the Wilts Friendly Society. They resemble each other very much in respect to the rural character of the districts over which the two societies are distributed, but in the ratio of sickness experienced by them the difference is very great. Both societies were established in the same year, 1828,—both societies are widely spread over districts almost purely agricultural, and both societies contain a large number of members. The following shews the rate of sickness experienced by the male members of each society:—

TABLE HH.

| Age.      | Rate of Sickness expressed in weeks,<br>experienced by |                |                      |
|-----------|--------------------------------------------------------|----------------|----------------------|
|           | Essex Society.                                         | Wilts Society. | Difference per cent. |
| 21 to 25  | 1.291                                                  | 0.743          | 72.409               |
| 26 ... 30 | 1.346                                                  | 1.071          | 25.677               |
| 31 ... 35 | 1.439                                                  | 0.929          | 54.897               |
| 36 ... 40 | 1.534                                                  | 0.743          | 106.461              |
| 41 ... 45 | 1.712                                                  | 0.486          | 252.263              |
| 46 ... 50 | 1.821                                                  | 0.600          | 203.500              |
| 51 ... 55 | 3.229                                                  | 0.843          | 283.036              |
| 56 ... 60 | 4.869                                                  | 0.771          | 531.518              |
| 61 ... 65 | 4.126                                                  | 1.929          | 113.893              |
| 66 ... 70 | 15.969                                                 | 2.285          | 598.652              |

The following two examples will also shew, in a striking manner, the ratio of sickness experienced by two other societies circumstanced very similarly in dense City Districts.

TABLE KK.

| Age.      | Ratio of Sickness yearly to each person, expressed in<br>weeks, experienced by |                                                     |                      |

| 51 ... 55 | 3.96                                                                           | 2.60                                                | 34.34                |
| 56 ... 60 | 3.95                                                                           | 2.32                                                | 41.27                |
| 61 ... 65 | 6.74                                                                           | 5.84                                                | 13.35                |
| 66 ... 70 | 21.96                                                                          | 10.90                                               | 50.37                |

The difference in the preceding results is certainly very remarkable, and must satisfy every inquirer as to the danger and disastrous consequences which must follow the applica-

tion of uniform Tables to all societies. It is hoped the preceding illustrations will have the effect of preventing members of benefit clubs from falling into some of the more prevalent errors in the management of these institutions. Of late the attention of the noblemen and the more wealthy residents in the English counties seems in an especial manner to be given to the means of elevating the condition of the agricultural and working classes, by the establishment of well-constituted friendly societies, and it is hoped the present edition of this treatise will be carefully studied by them. The first thirteen editions of the pamphlet entitled "Observations on Odd Fellow and Friendly Societies" have been eagerly sought after by the working classes, and although they were sold at a price involving a considerable pecuniary sacrifice, yet should the publication of the present edition of this work, in an enlarged and permanent form, cause it to find a place in the libraries of the landed gentry, so deeply interested in the welfare of the people, the loss sustained will be amply repaid.

The evil effects resulting from Tables badly constructed for the special purposes of individual societies, can with difficulty be seen for some years after their establishment, but in the course of time inadequate contributions begin to tell, in too evident terms, the ruin and calamity which are fast hastening on the society. A large society in one of the mining districts of England, which literally subsisted for a period of sixty years, until the very last farthing of its funds was expended, without any efficient steps having been taken for its regeneration, broke down under the awful and melancholy spectacle of having upwards of 300 members, all aged 50 years and upwards, incapable of entering any other friendly society, and who had to no purpose contributed to the funds for many years. So dreadful a catastrophe is but of too frequent occurrence, and its appalling aspect is sufficient to destroy in the working man all confidence in the stability of such institutions. However, there are sufficient examples of successful management of other societies to encourage their affluent and benevolent patrons to increased efforts towards the improvement and perfection of the only institutions of the country which legitimately and distinctly call for the prudential self-efforts of the millions of the people towards their own regeneration. The following are extraordinary examples of the very different conditions of friendly societies established and uniformly conducted under the best intentions and desires for permanent prudential provisions for the members and their families. The different results ultimately arrived at in each society are most instructive.

According to the valuation made by Mr. Ansell in 1848, for the Essex Provident Society, the results arrived at:—

|                                                                                                                                                                                                             |  |             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|-------------|
| "Present value" of the benefits promised to the members, assuming<br>that the experience of sickness in the society was no greater than<br>that indicated by the results of Mr. Ansell's treatise . . . . . |  | £208458·790 |
| "Present value" of future contributions . . . . .                                                                                                                                                           |  | £133517·573 |
| Accumulated capital . . . . .                                                                                                                                                                               |  | 33000       |

---

£166517·573

Deficiency of the funds according to Mr. Ansell's estimate . . . . .

£41941·217

---

But if the liabilities had been valued according to the actual scale of sickness to which the members are subject, the deficiency would be double the above amount. It is certainly very much to be regretted that so unfortunate a state of things should exist, that a society having been established for so long a period, should not have discovered the fallacious principles by which it is guided. Had the members adopted the plan of having periodical investigations into its affairs, and a valuation of its assets and liabilities by a competent authority, there can be no doubt that the present ruinous mode of proceeding would long ago have been checked, and a remedy applied; but now that so many of the members are advanced in life, it becomes exceedingly difficult to devise any satisfactory means likely to be adopted and carried out by the members for improving its condition.

Mr. Sotheron's recent Act will, however, for the future, render it compulsory on societies to make a return, once in every five years at least, of their assets and liabilities: and if this provision of the Act be strictly enforced, there can be no doubt that the results arrived at will occasion much useful debate and inquiry among members themselves, and finally establish sounder and more correct notions as to the management and principles of friendly societies.

Although such has been the unfortunate progress of the Essex Provident Society, there are others established in the kingdom on very similar principles, which have flourished, and are now in a really prosperous and promising condition. The following examples, if contrasted with the preceding, will shew that the scale of contributions and benefits under which one society prospers, another may decay and suffer. In the Hitchin Friendly Society, the following are the results of a valuation made in 1849, of its assets and liabilities:—

|                                                |                  |
|------------------------------------------------|------------------|
| "Present value" of gross liabilities . . . . . | £9225 17 0       |
| ... .. assets . . . . .                        | 9509 4 11        |
| Difference in favour of the society . . . . .  | <u>£283 7 11</u> |

The Hitchin Society, like the Essex Provident Society, is in a Rural District, but it is not ramified over a large space and divided into numerous branches. However, the Wilts Friendly Society, has upwards of seventy branches spread over the county, and in this respect resembles the Essex Provident Society, and may therefore be brought into comparison with it. The following are the results of an estimate of its assets and liabilities made during 1850:—

|                                               |                 |
|-----------------------------------------------|-----------------|
| "Present value" of its liabilities . . . . .  | £60610 15 5     |
| ... .. assets . . . . .                       | 61353 15 8      |
| Difference in favour of the Society . . . . . | <u>£743 0 3</u> |

Although the surplus here is but small, still it shews a very different state of things from that which belongs to the Essex Society, and it is a subject of considerable interest to understand distinctly the cause of this. It has already been seen that the rate of sickness in the latter society exceeds that for all societies collectively in England and Wales, by more than 40 per cent., while the rate of sickness in the Wilts Society has actually fallen short of that for the societies of the Rural Districts of the kingdom, and hence there is, in this fact alone, an important reason for the prosperity of the one society, and the disastrous condition of the other. These examples should be sufficient to satisfy every inquirer of the difficulties which surround such questions, and the need of judgment and experience being brought to bear on all efforts made to regenerate old societies, or to establish new ones.

Since the preceding observations were written a Return of the sickness and mortality experienced by friendly societies during the quinquennium, ending the 31st of December, 1851, has been printed by order of the House of Commons, in Parliamentary Papers, No. 955 of 1853, and No. 506 of the year 1854. The data embraced by this Return extend to 792,939 years of life, and are therefore, in magnitude, second only to the data originally brought forward in these Contributions, which included 1,217,783 years of life.

TABLE LL.

*Sickness and Mortality for Quinquennial Terms of Life according to the Government Returns relating to Friendly Societies in England and Wales.*

1846-50.

| Age.      | SICKNESS.                                           |                            |                             | MORTALITY.              |                   |                     | Age.      |
|-----------|-----------------------------------------------------|----------------------------|-----------------------------|-------------------------|-------------------|---------------------|-----------|
|           | Number exposed to the risk of Sickness at each Age. | Total Sickness (in Weeks). | Average Sickness per Annum. | Number exposed to Risk. | Number of Deaths. | Mortality per Cent. |           |
| 10        | 16                                                  | 20·571                     | 1·2857                      | 16                      | ...               | ...                 | 10        |
| 11 to 15  | 2939                                                | 2115·214                   | 0·7197                      | 2940                    | 16                | 0·5442              | 11 to 15  |
| 16 ... 20 | 25087                                               | 24476·500                  | 0·9757                      | 25098                   | 169               | 0·6734              | 16 ... 20 |
| 21 ... 25 | 88528                                               | 86781·071                  | 0·9803                      | 88556                   | 645               | 0·7284              | 21 ... 25 |

| 41 ... 45 | 94631                                               | 118405·786                 | 1·2512                      | 94692                   | 1050              | 1·1089              | 41 ... 45 |
| 46 ... 50 | 77550                                               | 116491·000                 | 1·5021                      | 77649                   | 1057              | 1·3613              | 46 ... 50 |
| 51 ... 55 | 54693                                               | 101470·500                 | 1·8553                      | 54778                   | 950               | 1·7343              | 51 ... 55 |
| 56 ... 60 | 39974                                               | 92677·286                  | 2·3184                      | 40061                   | 1009              | 2·5187              | 56 ... 60 |
| 61 ... 65 | 23438                                               | 78633·000                  | 3·3549                      | 23496                   | 699               | 2·9750              | 61 ... 65 |
| 66 ... 70 | 13398                                               | 67801·286                  | 5·0606                      | 13462                   | 648               | 4·9622              | 66 ... 70 |
| 71 ... 75 | 5591                                                | 47382·071                  | 8·4747                      | 5619                    | 374               | 6·6560              | 71 ... 75 |
| 76 ... 80 | 2147                                                | 25432·071                  | 11·8454                     | 2163                    | 222               | 10·2635             | 76 ... 80 |
| 81 ... 85 | 635                                                 | 9650·000                   | 15·1969                     | 644                     | 101               | 15·6832             | 81 ... 85 |
| Total .   | 792939                                              | 1145425·142                | 1·4445                      | 793718                  | 9971              | 1·2562              | Total.    |

(see Table E, pp. 20-7, and Table L, pp. 68-75). The Government Returns therefore contain about 65 per cent. of the amount of experience embodied in the First and Second Editions of this Work, but not one half the extent of data now brought under consideration. On referring to p. 424, preceding, it will be found that the Odd Fellow data are not quite so extensive as the Government Returns;—they extend to 621,561 years of life. The preceding is a condensed Abstract of the Government Returns made from the results given in p. 2 of Parliamentary Paper, No. 955 of 1853.

In Table LL there are several features of interest to which it is important to make detailed reference.

It will be observed that between ages 11-40 the rate of sickness is higher than that contained in Table E, pp. 26-7, but after that age the ratio of sickness is very much less; and to this circumstance attention is, in the first place, directed; but in order to understand better the relation between the results of the Government Returns, and those deduced from other inquiries, the following Table is submitted.

TABLE MM.

*Average ratio of Sickness, per annum, during each quinquennium, expressed in Weeks, according to:—*

| Age.      | Table E, pp. 26-7.    |               | Odd Fellows, p. 424. |               | Essex Provident, p. 436. |               | Government Returns, p. 440. |               |
|-----------|-----------------------|---------------|----------------------|---------------|--------------------------|---------------|-----------------------------|---------------|
|           | In each period = (a). | $\Sigma$ (a). | In each period = (b) | $\Sigma$ (b). | In each period = (c).    | $\Sigma$ (c). | In each period = (d).       | $\Sigma$ (d). |
| 21 to 25  | 0.8564                | 0.8564        | 0.7046               | 0.7046        | 1.291                    | 1.291         | 0.9803                      | 0.9803        |
| 26 ... 30 | 0.9014                | 1.7578        | 0.7652               | 1.4698        | 1.346                    | 2.637         | 0.9928                      | 1.9731        |
| 31 ... 35 | 0.9248                | 2.6826        | 0.8607               | 2.3305        | 1.439                    | 4.076         | 0.9766                      | 2.9497        |
| 36 ... 40 | 1.0718                | 3.7544        | 0.9783               | 3.3088        | 1.534                    | 5.610         | 1.1191                      | 4.0688        |
| 41 ... 45 | 1.3443                | 5.0987        | 1.2274               | 4.5362        | 1.712                    | 7.322         | 1.2512                      | 5.3200        |
| 46 ... 50 | 1.7185                | 6.8172        | 1.6249               | 6.1611        | 1.821                    | 9.143         | 1.5021                      | 6.8221        |
| 51 ... 55 | 2.3231                | 9.1403        | 2.1959               | 8.3570        | 3.229                    | 12.372        | 1.8553                      | 8.6774        |
| 56 ... 60 | 3.2773                | 12.4176       | 3.4839               | 11.8409       | 4.869                    | 17.241        | 2.3184                      | 10.9958       |
| 61 ... 65 | 5.4983                | 17.9159       | 5.7655               | 17.6064       | 4.126                    | 21.367        | 3.3549                      | 14.3507       |
| 66 ... 70 | 11.1279               | 29.0438       | 6.9265               | 24.5329       | 15.969                   | 37.336        | 5.0606                      | 19.4113       |

From the columns headed with the symbol of summation,  $\Sigma$ , it will be seen that the aggregate amount of sickness between ages 21-65 is nearly equal in Table E and in the Odd Fellow data; while in regard to the Government Returns it will be found that the aggregate amount of sickness is about equal between ages 21-50; but after the age of fifty, in fact, after forty-five, the Government Returns exhibit a greatly diminished ratio of sickness as compared with any of the other Tables now under consideration, and to this feature of the Government Returns it is important to direct attention.

An examination of the rate of sickness given in page 413, *ante*, will shew that, above the age of 45, in the Government Returns, it is very much lower than even that of

Mr. Ansell's Tables; indeed, their rate of sickness is lower at age 45 than any other recognised Table extant; it will be further seen that, at the higher ages, the rate of sickness is a close approximation to that set forth in the now discarded Table of the Highland Society, and between ages 65 and 70 is actually about 35 per cent. less than that of the Highland Society. It is important to understand the reason of so low a rate of sickness at the advanced ages.

The solution of this strange and remarkable feature will probably be, to a great extent, if not wholly, accounted for by the following passages in the Government Returns themselves.

"The cases of superannuation were carefully separated from the mass, and subjected each one to a rigid scrutiny to determine whether it was a case of *chronic sickness* or a case of superannuation, in the sense of retirement on a pension for *old age*. Where it was the case of a man under 60 set down technically, and technically only, as superannuated, with a *possibility of his restoration* to health and position as a contributing member, that man's case was classed under the head of sickness; the principle being to retain as many of these cases in the latter category as possible. The sickness tabulated, therefore, is the whole sickness that could be ascertained to be really such."—Parliamentary Paper, 16th August, 1853, p. vi.

And again:

"It is clearly to be understood that although separate cases of sickness, occurring to the same individual during each year, were added together so as to make the return perfectly accurate, yet that nothing but sickness in the true sense of the word, that is, sickness incapacitating from labour, and *requiring constant medical treatment, and of limited duration*, as contradistinguished from *chronic ailment*, and mere decrepitude, was considered to be sickness. For instance, *slight paralysis, blindness, mental disorder, or senile infirmity*, cannot, it was thought, fairly be classed with the sickness commonly prostrating the workman, and for relief under the visitation of which he seeks the aid of a benefit club. In the abstraction of the data on which the Tables now submitted are founded, all cases of the *above*, or any other description of *chronic malady*, which were returned under the head or term of superannuation, were carefully eliminated, where no cessation of this title to relief, and where no return to the ordinary conditions under which allowances are drawn in sickness, could be perceived."—Parliamentary Paper, 12th August, 1854, p. 7.

The preceding is certainly one of the most extraordinary circumstances connected with any inquiry hitherto made, as to the prevalence of sickness in friendly societies. It would seem as if the whole object and purpose for which such societies are instituted were lost sight of. The benefits for which all societies profess to make provisions are, allowances to members during sickness, or rather incapacity, from either physical or mental causes, to follow their usual avocations or labours. It is nowhere a feature of a friendly society to guarantee allowances during temporary sickness only. If this were so, friendly societies

and benefit clubs would not be worth supporting, and having such objects only in view, they never could have enrolled the immense number of workmen which now belong to them. The great, essential, and the noblest feature in friendly societies of every description, is the certainty that, under a skilfully developed system, they will afford to members a competent support and complete independence during periods of sickness, incapacity, and disease, however protracted. The working man, for whom such societies are more particularly designed, may struggle against the difficulties of a temporary sickness without the aid of a friendly society, but few can hope to bear up against the vicissitudes invariably attendant on long protracted or permanent illness, and it is this condition of things for which not only the earliest but the most recently formed societies make special provision: and unless this integral element is allowed to have its full weight, the great principle which should govern every society is violated. It is quite true that, in many societies, even amongst those established of late years, a reduced amount of sickness allowance is granted during long continued sickness; but in no society worthy of the name does the allowance cease altogether, or fall to even so low a sum as four or five shillings weekly. An industrious workman with possibly a large family to support on so miserable a pittance, must be reduced to pauperism itself. Friendly societies fail in their mission when, by their rules, they sanction such degradation. At all times, even when science had not taken them under her protection, they aimed at other and nobler purposes than merely to allure the poor man into them for the purpose of ultimately placing him in the workhouse in his declining years, when much of all the sickness is of a permanent, or at least of a very protracted character. Their object is now, and always has been, a higher one. There is no reason why the sickness allowance should ever be reduced under eight or ten shillings weekly: and with such a sum an honourable struggle might be made for existence; but with less, the charm of independence is broken, and friendly societies become asylums for objects of charity, instead of self-supporting and dignified institutions, elevating the moral and social condition of the people.

If, therefore, the principle of some badly constituted societies of reducing the allowances so very low during long protracted or permanent sickness is to be so strongly condemned, what can be said of the extraordinary circumstance connected with the Government Returns now under consideration, in which all such elements of sickness are left out of the results which are submitted to the country for the guidance of its friendly societies? Had a scheme been purposely contrived to pauperize the members of all the benefit and provident clubs of the kingdom, it could not be more effectually calculated to do so, than by the dissemination with Government sanction of a ratio of sickness deduced from data, in which so vital elements are excluded as "chronic ailment," "mere decrepitude," "slight paralysis," "blindness," "mental disorder," and "senile infirmity." On referring to pp. 169-200 *ante*, it will be found that those are the very afflictions which press with unusual severity after members attain 45 or 50 years of age.

It is the proper function of a friendly society to enable the many to assist the few, and all properly developed data for the regulation of their risks, should be calculated to make provision for such contingencies and diseases as above enumerated, as well as for all others. It would however seem, as if those entrusted with the preparation of the Government Returns, had an idea that the best constituted friendly societies should only provide against "sickness incapacitating from labour, *requiring constant medical treatment*, and of *limited duration*." There is not an intelligent working member of a benefit club in the whole kingdom, who would subscribe to such a principle. At the superior ages, and long before the time of life when superannuation allowances, or strictly speaking, deferred annuities are granted, there is a large amount of protracted sickness experienced, as will clearly appear from results submitted in the subsequent part of this paper, and if during that period members who are afflicted are to be deprived of all benefit from the funds of their clubs, as the treatment of the Government Returns assumes, they must then be thrown on the charity of the country. The possibility of such a thing is, however, surely incompatible with the scheme of any properly regulated and self-supporting provident institution, and such a character all friendly societies which the Government encourages ought to maintain.

The history of this practice as introduced into many friendly societies, chiefly within the last thirty or forty years, is simply as follows. Societies generally, until quite recently, commenced their career with promising members benefits for which their contributions were wholly inadequate to make ample provision; but with the limited knowledge at one time existing of the laws of sickness and mortality, everything seemed to prosper for many years, until the members who, for the most part, entered such societies young, increasing in years and infirmities, made large inroads on the funds, and then the evils of the bad adjustment of benefits and contributions became apparent. Societies, when in this insolvent condition, soon began to have recourse to every possible expedient, except the right one, to prevent themselves from sinking, and amongst other means of propping up the falling institutions, the members, seeing the great drain on their resources on account of protracted and permanent sickness, very naturally under such circumstances, reduced the amount of the allowances. The reduction was, however, rarely so great as to bring the benefits to less than two-thirds or one-half of the full pay allowance. New societies starting into existence in succeeding years, very generally copied the schemes and regulations of their predecessors, and hence the practice of reduced benefits in long continued sickness. In every instance when the reduced allowance brings the benefit to so low a scale as to be no longer adequate with prudent management to support the member in sickness, he is necessarily thrown on the parish for support, and every such society should be discouraged as wanting in the essential characteristic of a well founded institution.

If, in the analysis of the Government Returns, the elements in question had been

eliminated from the general results in order to satisfy scientific curiosity, or otherwise, and if the nature and extent of them had been furnished in another part of the published Report, no objection could have been taken to such a course, but on the contrary, useful deductions might have been drawn from that mode of treating the data: but, unfortunately, these elements have been excluded from the general results, and no record of them is given by which any one can discover the actual amount of sickness to which the various societies included in the Government Returns have been subject. The consequence is, that practically, the Returns are for all the more important purposes of friendly societies entirely worthless, in fact, from the auspices under which such defective data appear, they are calculated seriously to undo much of the good, and to destroy many of the improvements, effected in the condition of those societies during the last ten years,—the period of greatest progress in their history. The evils to be so deeply lamented in the constitution of many societies, from the adoption of the data of the Highland Society, will be but little mitigated, particularly at the higher and more important ages, by taking the data now offered by the Government for their guidance. A Committee of the House of Commons reported unfavourably, so far back as 1825, on the Highland Society's Table; and before Lord Beaumont's Committee of the Lords in 1848, and Mr. Sotheron's Committee of the Commons in 1849, conclusive evidence was adduced as to the dangerous character of the same Table. Since then, the experience of the Manchester Unity of Odd Fellows, and now the Government Returns themselves as decidedly prove the Highland Society's Table to be fallacious, and, as a consequence, demonstrate the inapplicability of the results of the Government data as now analysed for the purposes of friendly societies.

That the exclusion of the elements in question is the cause of the low ratio of sickness expressed by the Government Table, will appear evident from a consideration of the following analysis of a portion of the data appearing in this Contribution, as well as that already furnished in the five Abstracts in pp. 160-4 *ante*. On referring to Abstract D, p. 161, it will be found that the average duration of each attack of sickness not ending in death varied from four or five weeks' sickness at the younger and middle periods of life, to from 100 to 300 weeks at the more advanced ages; and, whatever may be the cause of this prolonged sickness, it equally incapacitates a member from following his occupation, and entitles him to the sickness allowances of his club. The following is a condensed Abstract of the experience of twenty-five societies over an average period of nearly twelve years each. It will be found full of curious interest and instruction, and is calculated to throw much light on the question now discussed.

It will be observed, from the results of the following Table, that from the youngest to the oldest age there is a rapidly increasing ratio of prolonged sickness. From 20 to 50 years of age the number of persons suffering from protracted sickness varies from about  $2\frac{1}{2}$  per cent. to nearly 5 per cent., but after the latter age the increased number of persons

TABLE NN.

*Ratio of Persons suffering from protracted Sickness to the total number Sick at various terms of life. The shortest duration of any one attack of what is termed protracted Sickness, being at least One Year.*

| Age.      | (a)<br>Total Number of<br>Persons actually sick. | (b)<br>Total Number of<br>Persons suffering from<br>protracted Sickness. | Ratio of (a) to (b.) |
|-----------|--------------------------------------------------|--------------------------------------------------------------------------|----------------------|
| 11 to 20  | 90                                               | 1                                                                        | 1.111                |
| 21 ... 30 | 847                                              | 21                                                                       | 2.479                |
| 31 ... 40 | 738                                              | 23                                                                       | 3.116                |
| 41 ... 50 | 548                                              | 27                                                                       | 4.927                |
| 51 ... 60 | 345                                              | 48                                                                       | 13.910               |
| 61 ... 70 | 175                                              | 80                                                                       | 45.714               |
| 71 ... 80 | 58                                               | 41                                                                       | 70.690               |
| 81 ... 90 | 17                                               | 15                                                                       | 88.235               |
| Total . . | 2818                                             | 256                                                                      | 9.084                |

liable to diseases of long duration is very considerable, and must tell seriously on the funds of a society. Between ages 61–70, upwards of 45 per cent. of all the persons sick are attacked with affections which either permanently incapacitate them, or from which recovery does not take place for upwards of one year from the date of attack. It is hence abundantly evident that every society must make some provision for this class of its members. Even at the term of life 51–60 the protracted sickness is about 14 per cent., and the neglect of a small number of such cases in the analysis of the Government Returns will fully account for results so discordant with every other series of observations. It has already been shewn in Table MM that at ages under 45 the ratio of sickness is somewhat higher in the Government Returns than according to the results of this inquiry; in fact, the aggregate sickness between ages 21–50 is, as nearly as possible, the same. In the subsequent terms of life, however, the Government Tables exhibit a very reduced ratio of sickness. The cause of this will appear evident from the facts adduced in the preceding Table. “Chronic ailments,” “mere decrepitude,” “slight paralysis,” “blindness,” “mental disorder,” and “senile infirmity,” are affections characteristic of advanced ages, and usually of a protracted nature, and their exclusion must produce results such as those appearing in the Government Returns.

Some of the societies in Scotland, whose experience is recorded in Table L, pp. 68–75 *ante*, make a distinction between acute sickness and that which permits of “walking about” out of doors. This latter sickness, in many instances, resembles the “protracted sickness” of the preceding Table, and the ratio of it to the total sickness will accordingly be found to increase with increase of age. The following is the result of an analysis of the sickness experienced by the societies which make the distinction now explained.

TABLE OO.

*Ratio of "Walking about" Sickness to Total Sickness at various terms of life—expressed in weeks.*

| Age.      | Population. | Total Sickness. | Walking about Sickness. | Ratio of Walking about Sickness to Total Sickness. |
|-----------|-------------|-----------------|-------------------------|----------------------------------------------------|
| 10 to 15  | 133         | 29·000          | 13·286                  | 45·813                                             |
| 16 ... 20 | 1049        | 958·428         | 574·714                 | 59·964                                             |
| 21 ... 25 | 4139        | 3807·714        | 2083·571                | 54·720                                             |
| 26 ... 30 | 6845        | 5830·285        | 2951·285                | 50·620                                             |
| 31 ... 35 | 7182        | 5681·429        | 2680·427                | 47·179                                             |
| 36 ... 40 | 6697        | 5929·999        | 3307·713                | 55·779                                             |
| 41 ... 45 | 5613        | 6345·142        | 4176·000                | 65·814                                             |
| 46 ... 50 | 5015        | 7495·571        | 4643·856                | 61·955                                             |
| 51 ... 55 | 4234        | 9812·714        | 6735·570                | 68·641                                             |
| 56 ... 60 | 3204        | 9615·572        | 7073·571                | 73·564                                             |
| 61 ... 65 | 2163        | 10558·572       | 8899·236                | 84·285                                             |
| 66 ... 70 | 1164        | 12203·142       | 9868·285                | 80·867                                             |
| 71 ... 75 | 616         | 10147·714       | 8400·143                | 82·779                                             |
| 76 ... 80 | 330         | 7315·714        | 6472·286                | 88·471                                             |
| 81 ... 85 | 129         | 2968·857        | 2616·143                | 88·120                                             |
| 86 ... 90 | 30          | 876·000         | 772·000                 | 88·128                                             |
| 91 ... 95 | 3           | 2·000           | ...                     | ...                                                |
| Total     | 48546       | 99577·853       | 71268·136               | 71·570                                             |

From this Table it will be seen that at advanced ages, when the more chronic forms of disease prevail, as shewn in pp. 169–99 *ante*, the ratio of "walking about" sickness is much increased. Between ages 21–50, the ratio is from 50 to 60 per cent., but above the age of 50, the ratio varies from 68 to 88 per cent., and on the average of all ages, the ratio of "walking about" sickness is 71·570 per cent. Consequently, when sick pay is regulated by this distinction, it must materially affect the liabilities of the societies, and in all such cases the data furnished in the preceding Table will be found valuable in the adjustment of the contributions and benefits. In like manner will the data of protracted sickness, given in Table NN, be found useful in the determination of the rates for societies in which the benefits are affected by the duration of the sickness.

It may not be without interest to direct attention, at this place, to the sickness experienced by one of the largest societies connected with the great railway interests of this country. The following Table shews the amount of sickness experienced by the Great Western Railway Friendly Society during the five years ending December 1851.

In the following Table it will be found that the total amount of sickness was 7189·429 weeks, while, according to the ratio of England and Wales generally, as given in Table V, p. 409, the amount of sickness would have been 6145·048 weeks only; but the feature to which attention is more particularly directed in the following Table is the relation of "full-pay" sickness to the total sickness. From this Table it appears that

## INFLUENCE OF LOCALITY ON SICKNESS.

TABLE PP.

*Sickness experienced by the Great Western Railway Friendly Society—expressed in weeks.*

| Age.      | Number of Years' Risk. | Total Sickness. | Full-Pay Sickness only. | Ratio per Cent. of Full-Pay Sickness to Total Sickness. | Sickness per annum to each Member. |
|-----------|------------------------|-----------------|-------------------------|---------------------------------------------------------|------------------------------------|
| 21 to 25  | 1032.5                 | 1061.286        | 1061.286                | 100.000                                                 | 1.028                              |
| 26 ... 30 | 2219.0                 | 2274.857        | 2123.857                | 93.350                                                  | 1.025                              |
| 31 ... 35 | 2049.0                 | 2279.572        | 1921.429                | 84.660                                                  | 1.112                              |
| 36 ... 40 | 817.5                  | 974.142         | 811.999                 | 83.355                                                  | 1.192                              |
| 41 ... 45 | 241.5                  | 301.285         | 301.285                 | 100.000                                                 | 1.248                              |
| 46 ... 50 | 56.0                   | 112.001         | 112.001                 | 100.000                                                 | 2.000                              |
| 51 ... 66 | 17.5                   | 186.286         | 33.857                  | 18.175                                                  | 10.645                             |
| Total . . | 6433.0                 | 7189.429        | 6365.714                | 88.545                                                  | 1.115                              |

the great bulk of the members of the society being under the age of 40, the "full-pay" sickness amounted, on the average, to no more than 88.545 per cent. of the whole sickness, the remainder or 11.455 per cent. being of the protracted character, which during the term of life 51-66 was 81.825 per cent. of all the sickness of that period.

Another interesting illustration of the character of the diseases producing temporary and permanent sickness, as well as "bed-lying" and "walking-about" sickness, is derived from the experience of the "Thistle and Rose" during the years 1841-8.

TABLE QQ.

*Duration of Temporary and Permanent Sickness, distinguishing Bed-lying from Walking-about Sickness, from attacks of various classes of Disease—expressed in Weeks.*

| Class of Disease.                                                              | Number of Persons Sick. | Amount of Sickness expressed in Weeks. |          |            |          |                                       |                                            |
|--------------------------------------------------------------------------------|-------------------------|----------------------------------------|----------|------------|----------|---------------------------------------|--------------------------------------------|
|                                                                                |                         | Temporary.                             |          | Permanent. |          | Total amount of Sickness experienced. | Average amount of Sickness to each Person. |
|                                                                                |                         | Bed-lying.                             | Walking. | Bed-lying. | Walking. |                                       |                                            |
| I. Zymotic Diseases . . . . .                                                  | 90                      | 242.429                                | 138.858  | ...        | ...      | 381.287                               | 4.236                                      |
| II. Dropsy, Cancer, and other Diseases of uncertain or variable seat . . . . } | 10                      | 68.859                                 | 6.000    | ...        | ...      | 74.857                                | 7.486                                      |
| III. Tubercular Diseases . . . . .                                             | 16                      | 28.429                                 | 80.571   | ...        | 7.571    | 116.571                               | 7.286                                      |
| IV. Diseases of the Brain, Spinal Marrow, Nerves, and other Senses . . . }     | 47                      | 240.571                                | 169.571  | 103.857    | 945.286  | 1459.284                              | 31.048                                     |
| V. Diseases of the Heart and Blood Vessels . . . . .                           | 5                       | 61.714                                 | 22.714   | 6.857      | 28.286   | 119.571                               | 23.914                                     |
| VI. Diseases of the Lungs, and of the other Organs of Respiration . . . . }    | 72                      | 297.287                                | 126.572  | 230.571    | 114.143  | 768.573                               | 10.925                                     |
| VII. Diseases of the Stomach, Liver and other Organs of Digestion . . . }      | 43                      | 103.571                                | 130.000  | ...        | ...      | 233.571                               | 5.432                                      |
| VIII. Diseases of the Kidneys, &c. . . . .                                     | 3                       | 23.571                                 | 11.714   | ...        | ...      | 35.285                                | 11.762                                     |
| X. Rheumatism, Diseases of the Bones, Joints, &c. . . . .                      | 42                      | 132.714                                | 224.858  | 16.429     | 330.857  | 705.858                               | 16.806                                     |
| XI. Diseases of the Skin, Cellular Tissue, &c. . . . .                         | 10                      | 46.429                                 | 22.143   | 29.857     | ...      | 98.529                                | 9.843                                      |
| XIII. Debility . . . . .                                                       | 10                      | 13.429                                 | 30.000   | ...        | 14.286   | 57.715                                | 5.772                                      |
| XVII. Violence, External Causes, Injuries, &c. . . . .                         | 37                      | 105.714                                | 106.857  | ...        | 2.000    | 214.571                               | 5.799                                      |
| All Causes . . . . .                                                           | 385                     | 1365.715                               | 1069.858 | 387.571    | 1442.429 | 4265.572                              | 11.079                                     |

The data, it will be observed, are not sufficiently numerous in the preceding Table to justify the insertion of the sub-divisions of each class of disease, but the results, as above given, are, notwithstanding, highly instructive on the question of protracted sickness. The classification of the diseases is the same as that followed in pp. 172-9, *ante*. The highest ratio of permanent and protracted sickness will be found in Class IV, Diseases of the Brain and Nervous System, and, as already pointed out in various parts of this Contribution, as well as in p. 183, *ante*, this class of disease is characteristic of the more advanced ages. Classes VI and X stand next in order with respect to permanent sickness, the principal invaliding being from Asthma in the former, and from Rheumatism in the latter. The last column of the preceding Table shews the average duration of temporary and permanent sickness in the aggregate, and it will be found that the various classes of disease stand in the following order in regard to the duration of the attacks of sickness, namely, IV, V, X, VIII, VI, XI, II, III, XVII, XIII, VII, and I, the zymotic class of disease shewing, as might be expected, the shortest duration of attack. The highest duration is 31.048 weeks, being in Class IV, Diseases of the Brain and Nervous System, the shortest, as just stated, in Class I, Zymotic Diseases, being 4.236 weeks, and the average of all is 11.079 weeks.

These facts it is believed are quite sufficient to point out the importance of protracted and permanent sickness being provided for in the pecuniary scheme of every properly constituted friendly society, and the danger attendant on the use of data from which elements so important have been excluded.

The following are the results of a combination of the elementary data of some interest, in a form not hitherto attempted, and from which some useful conclusions may be drawn. In the preceding Tables the rate of mortality has invariably been regarded in relation to every member of the society or societies, at the given ages; but in column 2 of the following Table will be found the results of a different combination. All the members, at every year of life, or rather all the members of exactly the same age, being placed in one group, the number of these that had actually experienced sickness during the course of that year of life was recorded. And these being abstracted from the total number of members of the same age, column 2 was deduced, expressing for quinquennial periods of life the per-centage of members that are actually sick in the course of one year; for example, out of every hundred members aged 31-35 in a society, twenty-one will be on the sick list during some part of the year; but of the same number of members aged 61-65, at least thirty-five members will be sick during some period or other of the year.

An inspection of column 2 will shew that, from the younger ages up to the period 31-35, the ratio or chance for any given member to be sick diminishes; but that from that period of life upwards, the tendency for any given member to be sick increases in a uniform and regular series. No Table of this kind has hitherto existed; and it is

believed, that in addition to the more general purposes of Vital Statistics, it will be practically useful to benefit societies, in enabling them to determine whether the numbers on their sick list be greater or less than the average. Table V will afford a means to determine whether the total amount of sickness in a society be greater than the average; but the present Table simply points out the proportion of members to be expected on the sick list, and is perhaps more important than the other, as a test of the means of selection adopted for the admission of members.

Column 3 is simply a modification of column 2, and needs no explanation further than to state, that it will afford a ready means of testing the relation of the sick to the non-sick members in any one year, when placed in separate groups, as is generally done in benefit societies.

TABLE RR.

| Age.       | Per-Centage of Members Sick during each Year. | Ratio of Sick Members to every 100 not Sick in every Year. | Mortality per Cent. among those Actually Sick. | Sickness per Annum among those Actually Sick. | Total Amount of Sickness to each Death. | Age.       |
|------------|-----------------------------------------------|------------------------------------------------------------|------------------------------------------------|-----------------------------------------------|-----------------------------------------|------------|
| 11 to 15   | 21.9565                                       | 28.1337                                                    | .9901                                          | 4.1231                                        | 416.4290                                | 11 to 15   |

| 96 ... 100 | ...                                           | ...                                                        | ...                                            | ...                                           | ...                                     | 96 ... 100 |

In Tables E, F, and G, &c., the rate of mortality was given for the general population of friendly societies; but in the fourth column of the preceding Table will be found the mortality per cent. among those persons actually sick. The mortality among the population generally has been shewn to increase with age; so also does the mortality among those persons actually sick increase with age.

In the quinquennial period of life, 21-25, the mortality among those sick is 3.0539 per cent.; but in the advanced period of life, 66-70, the mortality is increased to 9.6004 per cent., or more than three times that of the other period. An inspection of this column will shew that there is a uniform and gradual increase of the rate of mortality.

Tables of this kind are calculated to throw important light on the subject of Vital Statistics. A chronological series would point out any change or modification that may have taken place in the intensity and severity of disease. By the aid of the information given in column 4, premiums may easily be determined for the assurance of lives while actually sick; but as the results in that column do not distinguish sickness under particular diseases, a knowledge of the disease under which the patient might be suffering would be of no assistance to parties undertaking the risk: but if particular diseases, with the sickness and mortality under each, were given in separate classes, then the results would apply to given diseases, in the same manner in which the above results will apply to sickness in general, irrespective of disease. An application of columns 2 and 4 will afford the means of measuring the exact liabilities of a friendly society; and if the same means were available to an assurance company of ascertaining the ratio of its members sick, the principles of determining the liabilities in those companies would undergo an important change.

Suppose that any particular society contains 3647 members, equally distributed over the ten quinquennial terms of life, from 20 to 70 years of age, one thousand of them would be found on the sick list in the course of a year, and of one thousand persons found sick, fifty-six deaths would take place in that year; but if in the actual result the balance of those numbers was in any way disturbed, that circumstance would tend to shew whether the selection of lives in the society was of a favourable or unfavourable character.

The results in column 4 were obtained by direct observation; but it is evident that if  $m$  is made to represent the rate of mortality per cent. as given in Tables E and F, and  $a$  the results in column 2, then

$$\frac{m \times 100}{a} = \text{column 4.}$$

It is obvious that in applying the results in this Table to any practical purpose, independent calculations must be made for each term of years, otherwise errors of the same nature as those pointed out at page 45 would affect the result.

Column 5 of the same Table will be found to represent the amount of sickness per annum among those actually sick. From the age of 15 upwards, the amount of sickness will be found to increase in a regular and uninterrupted series. At the term of life, 21-25, there is 3.8518 weeks' sickness in a year to each person, but at the term 66-70 there is 24.2217 weeks' sickness to each person actually sick.

Without any further inquiry on this point, the manner in which it will bear on what is called permanent sickness in friendly societies is obvious. It will thus be seen, that not only have advanced years a greater liability to sickness, but that, once on the sick list, its duration receives a most remarkable increase. It will also be further seen, that at the

two terms of life, 21–25 and 66–70, the relative chances of being sick are in the ratio of 220 to 468, while the mortality at the same terms of life is in the ratio of 31 to 96 among those actually sick; and that the amount of sickness to those persons at the respective ages, shews the remarkable disparity of 39 to 242.

The cares, anxiety, and suffering with which the decline of life is thus beset, appear to form a most striking contrast to the improvident carelessness with which, in youth, any provision for those calamities is regarded. “If any man will not work, neither shall he eat;” and as “the time cometh when no man can work,” it is in the summer of life that abundant provision must be made for the vicissitudes of that winter which incapacitates for labour; but how mortifying must be the disappointment which falls on the hopes of those patient contributors to friendly societies, who, after thirty or forty years’ experience, find, in the decline of life, when thrown by their infirmities on those societies for support, no brighter prospect than the severe and harassing privations of pauperism, or the consolations of a workhouse.

The results of column 5 may be obtained in the same manner as that just described for column 4, viz.:—Let  $s$  represent the average sickness per annum, as given in Tables E and V, and  $a$  the results in column 2; then

$$\frac{s \times 100}{a} = \text{column 5.}$$

It must be kept in view, that the results in this column, as well as those given in the whole of the Table, will be much influenced by local circumstances and peculiarity of employment, and that it is not to be thought that they can be applied with safety to all societies promiscuously. Considerable experience and discrimination will always be required, to determine the due application of many of the most important practical results here presented.

Perhaps the most curious and interesting part of the preceding Table is column 6, as it presents some remarkable and novel features connected with Vital Statistics. A careful survey of the figures presented will shew, that although, as age advances, the human constitution has a greater tendency to decay, and greater liability to sickness, still it presents the apparent anomaly of having, in advanced life, a greater power of enduring sickness than in younger life; and that, although there is less power to resist the approach of disease, there is a higher capability of sustaining its insidious and destroying agency.

At the period of life 31–35, it will be seen that for every 116 weeks of sickness there is one death; but at the term of life 66–70, there is only one death for 252 weeks of sickness; or in other words, a greater amount of sickness is required to destroy life at advanced ages than at younger ages.

This peculiar feature, which seems to have been unexpected by those giving attention to such subjects, may be explained in several ways. Many of the diseases prevalent in younger life disappear in after years; and, in passing from the diseases peculiar to youth, other diseases ensue, which, although not so acute in their nature, are yet fatal in their results; and thus the change from the acute to the more chronic form of disease will impart increased duration, but not severity, to the sick-list of a society. Again, many fatal diseases of youth, such as Consumption and other Diseases of the Chest, do not, to any great extent, incapacitate from labour; and in those diseases the mortality may be high, while the amount of sickness is small.

Nothing like a proper enumeration of all the practical applications of the preceding Table is here contemplated; but it may not be out of place to refer to a few of the more obvious uses to which it may be applied. In friendly societies, a correct record of the amount of sickness among the members will afford the means of predicting the number of deaths to be looked forward to, as well as the class of members among which such deaths are most to be expected. Investigations into the affairs of a society will also be much aided by a skilful survey of the relative amount of sickness to the deaths among the members. Provided that, over a sufficiently long period, an unusually large amount of sickness was found to prevail in relation to the number of deaths, it might be safely inferred that some peculiar element affected the results; but if both sickness and mortality should shew a marked augmentation beyond the calculated numbers, then such a feature might be regarded as evidence of an inferior condition of health among the members of that society. For the more important purposes of medical science, the results in column 6 are easily available. Perhaps no simpler numerical test could be offered of the efficiency of particular modes of treatment; but to apply the results here given with much success, the figures should have been classified according to the sickness and mortality of particular diseases. A portion of the elementary data will admit of such a classification; and it is intended to publish the results on some future occasion.

Suppose a medical practitioner to have within the circle of his patients one thousand persons, whose ages vary from 21 to 70 years, and equally spread over that term of life; according to the results here given, he ought to expect 274 of them to be on his sick list during the course of a year—that they would experience 2430 weeks' sickness in the aggregate—and that there would be about sixteen deaths out of that number in the same time; and presuming that he were to visit each patient every alternate day, it would produce 8505 visits in the course of a year, or about 23 visits daily. Societies and many other public bodies adopt a practice of paying an annual sum for medical attendance and advice; and it will thus be seen that means are available by which to calculate the probable amount of labour and time that may be required for the discharge of such engagements.

A few years since, in order to satisfy some speculations on the subject of Scrofula,

then under investigation by Mr. Phillips in the preparation of his distinguished Treatise on the Nature, Causes, and Prevalence of that disease, and also with the view of elucidating some points of an interesting inquiry, which was conducted about the same time by Dr. Guy of King's College, a combination was made of the data on which this contribution is founded, so as to exhibit the sickness and mortality of factory occupations, of in-door occupations requiring great exercise, and of the same occupations requiring little exercise, and also of out-door occupations requiring great exercise, and of the same occupations requiring little exercise. The classification of in-door and out-door occupations was intended to exhibit the difference, if any, due to fresh and pure air in contrast with that of impure air inhaled in confined places, and the further analysis of distinguishing between great and little exercise was intended to satisfy the requirements of certain conditions appearing in the results arrived at in pp. 1-66 *ante*. The following Table contains the results for factory occupations.

TABLE S S.

*Mortality and Sickness amongst Factory Occupations.—Rural Districts, Towns, and Cities.—Sickness expressed in Weeks.*

| Age.      | Population. | Deaths. | Mortality per Cent. | Total Sickness. | Sickness per Annum = (a.) | $\Sigma$ (a.) | Sickness per Annum Table E, data for England, = (b.) | $\Sigma$ (b.) |

| Total. .  | 44161       | 695     | 1.574               | 116103.225      | 2.629                     |               |                                                      |               |

Taking the whole range of the two classes of data compared in the preceding Table, no very decided or striking differences will be found. Under the age of 20, the sickness amongst the factory trades is high; in the next decennium, very low; and thence onward, sometimes higher and sometimes lower than for the whole of England and Wales. If the summation columns,  $\Sigma$ , be compared, it will be seen that the aggregate sickness in factory occupations, between ages 21–60, is nearly the same as that for England and Wales generally, and over the more extended period of life, 21–70, the sickness is less than in the country generally. After the age of 70, the numbers are too small to warrant comparison. This Table will be very useful as affording a test of the condition of health amongst those actively employed in this great branch of national industry. Those curious about the views which medical inquirers take of the results indicated in column 4, will be interested by a perusal of chapter IX in Mr. Phillips's Treatise on Scrofula.

In the next place, attention is directed to the results of the combinations shewn in the following Tables, T T and V V, the former shewing the mortality and sickness of in-door occupations requiring little exercise, and the latter requiring great exercise.

| Total . . | 24358       | 352     | 1.445               | 42725.993       | 1.754               |

The necessity of economising space, to prevent this volume growing to inordinate dimensions, will prevent Tables of Decrements from being given of the mortality in the two preceding and the two following Tables; but the next Abstract of the expectation of life for a few ages will serve to give a very correct idea of the relative degrees of mortality in the four classes of occupations now under consideration.

| Age. | Expectation of Life in   |                 |                           |                 |
|------|--------------------------|-----------------|---------------------------|-----------------|
|      | In-door Occupations with |                 | Out-door Occupations with |                 |
|      | Little Exercise.         | Great Exercise. | Little Exercise.          | Great Exercise. |
| 20   | 41.8822                  | 42.0133         | 37.8017                   | 43.4166         |
| 30   | 35.1170                  | 34.5022         | 30.1435                   | 36.5832         |
| 40   | 27.9113                  | 27.8004         | 23.0357                   | 29.1284         |
| 50   | 20.5022                  | 21.1805         | 17.2754                   | 21.9732         |
| 60   | 14.0430                  | 15.1413         | 11.0169                   | 15.5635         |
| 70   | 8.6490                   | 10.4407         | 4.5607                    | 9.3313          |

This Abstract is full of interest as to the effect of occupations on health. It will be observed that in regard to In-door occupations, the expectation of life differs little until after age 40, and then there is a decided difference in favour of the occupations requiring great exercise: but in respect to the Out-door occupations, the section requiring little exercise exhibits a most remarkable inferiority in the value of life. The results are certainly very striking, and are calculated to throw much light on many obscure and vexed questions connected with inquiries made into the sanitary condition of our large towns. These results are strongly corroborative of some of the observations made in the early part of this volume, and viewed in conjunction with the data contained in pp. 17-101 support the opinion that differences in occupations of the people have a greater influence on the mortality than any peculiarity due to differences in locality, the drainage of towns, or the ventilation of dwellings. The expectation of life in the section of Out-door occupations requiring little exercise is not only remarkably below that of the Out-door occupations with great exercise, but is actually less than either of the In-door sections, and is even 20 per cent. less than the In-door section with little labour. An extension of this branch of the inquiry would probably shew that concomitant with Out-door labour requiring little exercise, there may be peculiarities of personal habits not essential to the occupation itself; (as shewn in the preceding Contribution on intemperate lives,) which may to some extent account for the high rate of mortality.

The following Tables shew the rate of mortality and sickness at each term of life, for the two sections of Out-door occupations.

TABLE W W.

*Sickness and Mortality amongst Out-door Occupations requiring little exercise.—The Sickness expressed in Weeks.*

| Age.      | Population. | Deaths. | Mortality per Cent. | Total Sickness. | Sickness per Annum. |

In order to obtain a better view of the general results as to sickness, in not only the two preceding Tables, but also in Tables T T and V V, the following Abstract has been prepared.

*Sum of the rate of Sickness per annum at each quinquennial term of life—expressed in Weeks.*

| Age.      | In-door Occupations with |                 | Out-door Occupations with |                 | England and Wales, Three Districts. |
|-----------|--------------------------|-----------------|---------------------------|-----------------|-------------------------------------|
|           | Little Exercise.         | Great Exercise. | Little Exercise.          | Great Exercise. |                                     |
| 21 to 30  | 1·614                    | 1·397           | 1·920                     | 1·719           | 1·758                               |
| 21 ... 40 | 3·574                    | 3·160           | 3·736                     | 3·591           | 3·754                               |
| 21 ... 50 | 5·748                    | 6·176           | 6·842                     | 5·808           | 6·817                               |
| 21 ... 60 | 11·103                   | 11·029          | 11·822                    | 10·348          | 12·418                              |
| 21 ... 70 | 27·126                   | 27·287          | 29·633                    | 24·982          | 29·044                              |

As already stated in respect to the sickness of the In-door occupations, it will be seen that there is in the term of life 21-70 scarcely any difference between the two sections, but in regard to the Out-door occupations requiring little exercise, the same remarkable distinction which characterised the mortality is also observable in the sickness. The rate of sickness is very much in excess of any of the other sections. This is a most important circumstance, not only as affecting friendly societies, but other matters of public interest.

In vol. II. of "The Journal of the Statistical Society" will be found an interesting report by a committee of that society upon the sickness and mortality among the Metropolitan Police Force, during the eight years ending the 31st of December, 1838, being the eight years immediately succeeding the embodiment of that force in the year 1830. The committee in their report have given four very interesting Tables; but the following Table ZZ has been constructed from the original data in a different form from any of those furnished by the committee.

From column 3 it will be seen that the average force for the whole period of eight years was 3313, and the numbers were very nearly stationary during the whole of that period; but it is stated that it was found necessary to recruit annually as many as 1100 new members, the vacancies being created by 1068 who were removed or retired from the force, and 32 who died every year. From the institution of the force to the 31st December, 1838, no less than 14,548 had entered it, and the following shews the proportion entering at various ages:—

|      |           |          |           |           |
|------|-----------|----------|-----------|-----------|
| 32.0 | per cent. | admitted | under age | 26,       |
| 37.5 | ...       | ...      | from age  | 26 to 31, |
| 21.6 | ...       | ...      | ...       | 31 to 36, |
| 6.3  | ...       | ...      | ...       | 36 to 41, |
| 2.6  | ...       | ...      | above     | 41.       |

The ratios of removed and retiring at the corresponding ages were very nearly the same. The average duration of the service of each policeman was consequently about three years, and the average age on admission 28.5 years, and it will be further observed that 69.5 per cent. of all the men entered the force between ages 20 to 31.

The average mortality has been nearly one per cent., or a little under that for the population of England and Wales generally, as given in Table C, but very much greater than that found to prevail in friendly societies, as shewn in Table F, page 32. Attention is now directed to this Table, in consequence of the data forming a marked instance of a class of men undergoing a great amount of bodily labour in the open air. It is stated that each individual of the Police Force has to walk twenty miles every day in going his rounds; besides being obliged to attend charges at the police offices, estimated as equal to an additional five miles, making in all twenty-five miles a day. During two months  
[out of every

TABLE Z Z.

*Shewing the number of Weeks' Sickness among each Division of the Metropolitan Police Force for each Month during the Eight Years ending the 31st December, 1838.*

| District.       | Total Number of the Police Constables during Eight Years. | Average Number per Annum. | January. | February. | March.   | April.   | May.     | June.    | July.    | August.  | September. | October. | November. | December. | Total Sickness during the Eight Years. | Average Sickness per annum per man. |

out of every three each police constable was on night duty for nine hours each night, from nine o'clock in the evening to six o'clock in the morning, which must be considered excessive; and from the results given in Table ZZ is evidently detrimental to health. On referring to the last column of this Table it will be seen that the average amount of sickness was 1.4636 weeks to each member of the force, while according to Table V, the results for the City Districts should not have exceeded 1.100 per cent., and for the average of the three districts combined not more than 0.910 per cent.

It will be seen from an inspection of the results in the last columns of this Table that the rate of sickness has differed widely in the various divisions of the force. In the Kensington division the sickness per annum was only 0.8655 weeks per annum to each member, while, in the Holborn division, the sickness was as high as 1.8270 weeks yearly. In pages 166-8 *ante*, will be found several interesting illustrations of the effect of the various seasons of the year on the amount of mortality, and the Table now under consideration furnishes important information on the influence which the different seasons of the year have on the amount of sickness. Nearly the whole of the Police Force was under the age of 40, and therefore the results in Table ZZ should be compared with those in the second column of the first Abstract in page 168 *ante*.

|                                                       | Mortality (see page 168).    | Sickness (see Table ZZ).    |

| Quarter of highest Mortality and Sickness . . . . . } | October, November, December. | April, December, January.   |

Considering all the circumstances as to time and place, and that the one series of observations relate to Mortality, and the other to Sickness only, there is a much greater correspondence between the two classes of results than might have been expected. Table ZZ will be useful in illustrating the marked fluctuations due to the seasons of the year in the different districts of the Metropolis, and it has an important public interest on many questions now pending as to the efficiency of the Police Force, and the trying nature of the duties the members of that force are called on to discharge. A service in which the members cannot remain on the average, more than three years, must be really very irksome and laborious, and if recent facts confirm the results of the eight years' experience embodied in Table ZZ, greater credit is due to those connected with the Metropolitan Police Force than the public in its present temper seems disposed to accord to them.

For the purpose of a medical inquiry conducted by Mr. Maclaren two or three years since, it was thought important to make a similar investigation to that, the results of which are given in pp. 454-8 *ante*, into the effect of sedentary occupations on female life, and the next Table exhibits the results arrived at.

TABLE A B.

The following is a condensed Abstract of the sickness shewn in the preceding Table, from which it appears that until above 60 years of age the sickness of both sections of occupation is in excess of that of the males for the whole of England and Wales. Beyond the age of 60, the facts in the preceding Table are not sufficiently numerous to admit of comparison. It will be further seen in the following Abstract, that the sickness in the sedentary occupations is greatly in excess of that in the others.

## FEMALE TRADES.

*Sum of the rate of Sickness per Annum at each quinquennial term of life.—expressed in Weeks.*

| Age.      | Active Occupations. | Sedentary<br>Occupations. | England and Wales. |
|-----------|---------------------|---------------------------|--------------------|
| 21 to 30  | 2·983               | 3·942                     | 1·758              |
| 21 ... 40 | 5·919               | 6·975                     | 3·754              |
| 21 ... 50 | 9·324               | 13·354                    | 6·817              |
| 21 ... 60 | 12·966              | 17·682                    | 12·418             |

In relation to the ratio of sickness amongst female lives generally, without distinction of occupation, it is necessary to make some observations.

In many societies, such as the Essex, the Wilts, and others, the rate of sickness which prevails among the female members greatly exceeds that among the other sex. On the other hand there are other societies, such as the Female Society at Mold, established by Archdeacon Clough, in which the sickness is remarkably below the average rate for males generally in benefit societies. However, in the materials furnished in connection with the inquiry which gave rise to this Contribution, the results for female life shewed in the aggregate, a somewhat higher rate of sickness than the ratio for male lives, although falling much below the rate shewn in the Essex and the Wilts Societies. The following Table shews the results for female lives for the whole of England and Wales as compared with the corresponding results for the male sex.

TABLE A C.

*Sickness in England and Wales according to the data described in pp. 17-9 ante—expressed in weeks.*

In the Wilts Society the sickness amongst female lives exceeds that of the other sex about 50 per cent., and the following gives the ratio for the Essex Provident Society:—

## INFLUENCE OF LOCALITY ON SICKNESS.

TABLE A D.

| Total . . | 2021.0                                                               | 4400.674                                                 | 2.177                                                    |                                                          |                      |           |

The following Abstract of the two preceding Tables sufficiently shews that in female life, as well as in male life, the rate of sickness differs very widely: and the remarks made in respect to male life are, to a great extent, applicable to female life also, but from the recorded experience of the latter sex being more limited, the practical application of the results is rendered more difficult.

TABLE A E.

*Rate of Sickness in the Essex Provident Society, and in the Friendly Societies of England and Wales generally.*

## FEMALES.

| Age.      | Essex Society. | England and Wales. | Difference per Cent. |
|-----------|----------------|--------------------|----------------------|
| 21 to 25  | 1.471          | 0.825              | + 78.303             |
| 26 ... 30 | 2.480          | 1.069              | + 132.000            |
| 31 ... 35 | 2.622          | 1.242              | + 111.111            |
| 36 ... 40 | 2.412          | 1.379              | + 74.909             |
| 41 ... 45 | 1.723          | 1.504              | + 14.561             |
| 46 ... 50 | 1.236          | 1.794              | - 31.104             |
| 51 ... 55 | 4.215          | 2.872              | + 46.762             |
| 56 ... 60 | 1.601          | 2.688              | - 40.439             |

Having thus brought under consideration these facts in regard to the experience of females, it is unnecessary to follow them up with any remarks on this particular question, further than simply to caution the promoters of benefit clubs against the indiscriminate use of these materials by societies which admit female members.

While these sheets have been passing through the press I have received a copy of some notes on the Mortality and Sickness found to prevail amongst the Ancient Order of

Foresters, compiled from Returns for the three years 1850-2, obtained from the various Courts of that Order. They have been analysed by Mr. William Watkins, P.C.R., of Court "Star of Sussex," No. 1914, Brighton. In this publication by the Ancient Order of Foresters there are many points of interest to which reference might be made if there were sufficient space remaining for that purpose, but it will now be impossible to do more than give the following condensed Abstract of the results.

TABLE A F.

*Sickness according to the records of the Ancient Order of Foresters, for the Years 1850-2.*

| Age.      | Number liable to Sickness. | Total Number of Days' Sickness stated to have occurred. | Sickness to each person in |        | Age.      |
|-----------|----------------------------|---------------------------------------------------------|----------------------------|--------|-----------|
|           |                            |                                                         | Days.                      | Weeks. |           |
| 20        | 578                        | 2720                                                    | 4.706                      | .672   | 20        |
| 21 to 25  | 2758                       | 15417                                                   | 5.590                      | .799   | 21 to 25  |
| 26 ... 30 | 4281                       | 28367                                                   | 6.626                      | .947   | 26 ... 30 |

| 36 ... 40 | 3862                       | 29705                                                   | 7.692                      | 1.099  | 36 ... 40 |
| 41 ... 45 | 2900                       | 23593                                                   | 8.136                      | 1.162  | 41 ... 45 |
| 46 ... 50 | 2219                       | 21079                                                   | 9.499                      | 1.357  | 46 ... 50 |
| 51 ... 55 | 1068                       | 14543                                                   | 13.617                     | 1.945  | 51 ... 55 |
| 56 ... 60 | 551                        | 8564                                                    | 15.543                     | 2.220  | 56 ... 60 |
| 61 ... 65 | 174                        | 3737                                                    | 21.477                     | 3.068  | 61 ... 65 |
| 66 ... 70 | 146                        | 3096                                                    | 21.203                     | 3.029  | 66 ... 70 |
| Total . . | 22610                      | 176460                                                  | 7.805                      | 1.115  | Total.    |

From this Table it will be seen that until age 40 the sickness of the Foresters is quite as high as the rates in Table E, from age 40 to 50 somewhat less, but after the age of 50 the data are of so limited extent as to be wholly inapplicable. These data are of very meagre extent compared with those of the Odd Fellows, but it is most satisfactory to find that the Order is now so alive to its interests as to enforce such an investigation into its affairs as must necessarily have taken place in carrying out this inquiry. It is quite impossible that it can result otherwise than in the most beneficial results. Whenever sufficient attention is drawn to the nature and extent of the liabilities of the Order by the publication of its own experience, members will ponder over them and eventually approve of such measures as are calculated to place the Order on a good and sound financial basis.

For many purposes it is important to know the ratio of persons constantly sick, in a society or particular district. In the following Table the figures in the second column are deduced from Table E, pp. 26-7, and represent the ratio of persons constantly

sick for the whole of England and Wales. The figures in the second column will of course follow the same law as those in Table E itself.

TABLE A G.

*Ratio constantly Sick at various terms of Life.*

| Age.       | Number per<br>Cent. constantly<br>Sick. | Number of Males continually Sick<br>in England and Wales. |          | Age.      |

| 66 ... 70  | 21.4000                                 |                                                           |          |           |
| 71 ... 75  | 35.3960                                 |                                                           |          |           |
| 76 ... 80  | 50.1088                                 | 67414.13                                                  | 74489.71 | 71 ... 80 |
| 81 ... 85  | 54.3587                                 | 24084.54                                                  | 23624.75 | 81 ... 90 |
| 86 ... 90  | 62.4885                                 |                                                           |          |           |
| 91 ... 95  | 44.1758                                 |                                                           |          |           |
| 96 ... 100 |                                         | 1319.09                                                   | 1338.53  | 91 ... 95 |

From the third column of the preceding Table, it will be seen that of the male population above 10 years of age, 261182 or 4.5257 per cent. were constantly sick in 1841, and from the fourth column it will be found, that taking the population as given in the census of 1851, there must have been in that year 291421 constantly sick above 10 years of age, or on the average 4.4325 per cent. constantly sick. There are many important applications which may be made of this Table, but its construction is so simple that the ratios according to any other classes of data may be easily deduced.

At this place it may be again stated, that in applying the preceding results to individual classes, or in a few instances only, it should not be expected that they will in every case be confirmed. Nothing short of a refined classification is calculated to meet the peculiar aspect of all the cases presenting themselves. A review of Table V will shew the wide distinction which prevails between the ratio of sickness in the Rural, Town, and City Districts; and in particular trades or occupations the amount of sickness is sometimes double that in other employments. In sickness, therefore, as well as in mortality, it is obvious that general results can be but of little practical value. Suppose

it were attempted to conduct societies in Liverpool, or in any other large city in England, on the terms that would be adequate for societies in the Rural Districts of Kent and Essex—it is manifest that they could not be of long duration.

Here it may be also well to state, that if in any public inquiry it should be attempted to ascribe the increased amount of sickness in the Town Districts to the less healthy nature of the districts, or their peculiar local influence on health, the conclusion would certainly be fallacious. Arguments precisely similar to those made use of in reference to the mortality of those districts, will explain the differences in the ratio of sickness in the same places; and it is therefore to be inferred, that whatever sanitary regulations may be carried out for promoting the health of towns, still the wide distinction between the rates of sickness and mortality in particular districts will not disappear. The cause of that difference is beyond the reach of any sanitary measure; and unless a change were to take place in the character and machinery of the manufactures of a town, by which the workmen would be habituated to less restrained, but more natural and complete physical exercises, no improvement in the state of health is to be looked for.

The evils, which relate to health, and are represented, by some writers, to exist to so frightful an extent, and to connect themselves with defective sewerage, filthy streets, and ill-planned houses, are certainly overstated by them. The data brought forward have generally been of the most indefinite and insufficient nature; and when, in connection with this, the erroneous methods employed, and the promiscuous manner in which their figures are generally combined, are kept in view, it must seem surprising that the thinking and intelligent portion of the community should have given their opinions any credence, or believed their conclusions entitled to so much weight.

Perhaps no statistical facts are better established than the duration of life among the middle and upper classes of this country; and if the data brought forward in this paper be received as of sufficient merit to represent the duration of life among the working classes, it will then appear clear that any important change to be hoped for in the value of life in the Town Districts, must be effected through other means than sanitary regulations.

Those persons who purchase Government Annuities, and have dealings with Assurance Companies, are certainly beyond the reach of any improvements to be introduced by local regulations; and if cleanliness of habit, comfort of dwellings, and fresh air, be of themselves powerful elements in raising the standard of life, their influence should be felt among that class of persons. But what are the actual results? The poor workmen inhabiting the miserable streets of our large towns, and inhaling their supposed noxious vapours, are actually longer lived than the affluent and upper classes, whose easy circumstances enable them to inhabit comparatively the palaces of the kingdom.

It is evident, from the great disparity in the value of life among different classes of workmen, whose conditions as to whatever is within the scope of public sanitary measures are the same, that other elements must exist having a powerful influence on the duration of life. It will further appear, that by viewing the various classes of society more in connection with the physical exercises to which they are habituated, than in connection with their moral position and rank in society, and consequently with their sanitary condition, a better clue will be found to the differences in the duration of life. It is not to be expected that any arrangements whatever as to the drainage and planning of streets are likely to add to the longevity of a Tailor; but if it were possible to give to his frame the physical exercises of a Ploughman, 20 per cent. would be added to the duration of his life. Neither is it to be thought that the Plumber, Painter, and Glazier is to be relieved from the poison of the metallic emanations to which he is exposed; nor that the Clerk can inhale the fresh air, and indulge in those exercises necessary to develop his physical constitution, while he follows the drudgeries of the counting-house. It is an aggregation of these, and other employments similarly conditioned, which make up the excessive mortality of our large towns; and since it has been shewn in the preceding pages, that this class of lives is also less healthy even in the Country Districts, and that the Town populations are chiefly made up of persons following such occupations, the legitimate result to be expected is a shorter duration of life in Towns, independent of any local influence on health. If improvements and changes are to be effected in the sanitary regulations of our large towns and cities, let them at once be carried out—not upon the necessity of such municipal innovations to avert a pestilential havoc in human life—but on the true merits of the question—the comforts, conveniences, and elevation of taste, and moral purity, thence arising.

---

## RATES AND CONTRIBUTIONS OF FRIENDLY SOCIETIES.

---

THE influence of the preceding results on the Rates and Contributions of Friendly Societies is perhaps that which generally most concerns the members of those institutions, and it is proposed to add a few remarks bearing on this subject.

The first point to which attention will be directed is the Table at page 470, being the Value of Annuities, according to the Rates of Mortality, developed in this inquiry, for Friendly Societies in the Rural, Town, and City Districts of England and Wales,—for the average of these districts combined,—and also for Friendly Societies in Scotland.

The rate of interest assumed in the following calculations is three per cent. per annum. In almost every other calculation extant for the purposes of friendly societies, a higher rate of interest has been adopted; but a careful investigation of the returns on this point, as given in the Schedules referred to at page 18 *ante*, has shewn that in practice a higher rate of interest is not realised by societies.

The Commissioners for the Reduction of the National Debt have hitherto allowed friendly societies £3 16s. 0½d. per cent.; but even in the cases where this mode of investment has been taken advantage of, the difficulty of collecting all the funds at the moment they fall due, and of immediately employing them in the Government Stock, together with the balance, large as compared with the whole amount of the Societies' funds, usually kept in hand to meet approaching liabilities, renders it difficult to make much beyond three per cent\*. It is intended, on another occasion, to publish an account of the Money Transactions of those societies; this and some other points of interest will then be more fully entered on.

The distinguishing features of the rates of mortality in the respective districts, will of course develope themselves also in the same order or relation in the value of  
[annuities

\* The 13th and 14th Victoria, c. 115, limits the rate of interest to 3 per cent. to such societies as invest their money with the Commissioners for the reduction of the National Debt.

| 56   | 12.08888                  | 12.69900 | 61877                           | 60100    | 0.4727                          | 0.4387   | 104  | 0.77105                   | 0.82410  | 94841                           | 94687    | 5.3549                          | 5.1909   |
| 57   | 11.73952                  | 12.34450 | 62895                           | 61133    | 0.4937                          | 0.4581   | 105  | 0.32363                   | 0.48544  | 96145                           | 95674    | 7.2639                          | 6.4410   |

Annuities, although not in so marked a degree, nor to the same extent as in the simple Mortality Tables. If money made no interest, it is plain that the value of Annuities, and the numerical expression in the Expectation Tables or Mortality Tables of Collective Intensity, would be identical, and under that aspect Annuities would have a maximum value. Again, if money could realise an infinite amount of interest, Annuities would then be at a minimum value, and have the same expression for every Table of Mortality and every age in those Tables. To illustrate this, suppose money could realise 100 per cent., or always double or replace itself in the course of a year; and starting with unity, before the expiration of the first term of the annuity a new fund would have formed itself capable of meeting the annuity, and leaving exactly the original unit with which the start was made, ready to enter on the second term of the annuity in the same manner, and so on *ad infinitum*. Under such an aspect, no matter what Table of Mortality was employed, the values of annuities would differ but little, as unity would invariably be capable, from the interest realised only, of meeting every payment for an absolute term of years. It is therefore evident that the values of annuities involving the discount of money will always shew less distinction between different Tables of Mortality than the Tables themselves will shew; and that the higher the rate of interest, the less distinction is observable between the annuities of different Tables, as well as less difference between the values of annuities at various ages for the same Mortality Table.

On reference to page 37, it will be seen that the difference of Expectation between the Rural and City Districts at age 30 is 14.442 per cent.; but a comparison of the values of Annuities at that age for the same Districts, as given at page 470, will shew a difference of only 9.729 per cent. The following Abstract will give a concise view of the relative values of the two expressions:—

| Age. | Expectation of Life in |                 | Excess<br>per cent.<br>in favour of<br>Rural Districts. | Value of Annuities<br>Three per Cent. |                 | Excess<br>per cent.<br>in favour of<br>Rural Districts. |
|------|------------------------|-----------------|---------------------------------------------------------|---------------------------------------|-----------------|---------------------------------------------------------|
|      | Rural Districts.       | City Districts. |                                                         | Rural Districts.                      | City Districts. |                                                         |
| 20   | 45.3550                | 40.0148         | 11.774                                                  | 22.78605                              | 21.29054        | 6.563                                                   |
| 40   | 30.9724                | 26.0873         | 15.772                                                  | 18.60452                              | 16.45861        | 11.534                                                  |
| 60   | 16.6524                | 13.7685         | 17.318                                                  | 11.85797                              | 10.18722        | 14.090                                                  |

Again, for reasons precisely similar, less distinction will be found to exist between the values of Annuities for various ages in the same Table, than between the Expectations of Life for those ages; for example, the difference of Expectation between ages 30 and 60 in the Rural Districts is 21.7549 years, or nearly 57 per cent.; but the difference between the values of Annuities for those ages in the Rural Districts is 9.2097, or about 44 per cent. Like results will also be found for other ages, no matter what Table of Mortality

be employed: taking the general results for the Three Districts for ages 50 and 70, the difference of Expectation will be found to be 11.9863 years, or about 54 per cent.; but the difference in the values of the Annuities for those ages is 7.1460, or 46 per cent. The difference in this instance is however less than in the former, on account of more proximate and more advanced ages being taken; but with ages less proximate and less advanced, the difference will exceed that in either of the preceding cases. Let ages 10 and 50 in the Rural Districts be compared, and the difference of Expectation will be found to be 56 per cent., but the difference in the value of Annuities is only 37 per cent.

From these remarks respecting the relative values of Annuities, and the Expectation of Life in various Mortality Tables, it is not to be considered that practically it is a matter of indifference which Table may be used as a basis for calculations for the guidance of a Society. The objects of these remarks is intended to lead to quite the opposite conclusion, and to prevent those who are not thoroughly conversant with such subjects from hastily adopting any given Table, simply because the money test, by which it is generally brought into comparison with other Tables, shews but little difference. The success of every friendly society, and other Institution dealing in Life Contingencies, depends in a great measure on the proper investment of its funds; and although Annuities by two different Mortality Tables may apparently approximate to nearly equivalent values, still, before all the conditions of each Table are practically determined, the accumulation of interest as presumed on in the construction of the Tables, will ultimately realise the maximum difference which is found to prevail between the Expectation of Life for the respective Tables.

The following are the values of Annuities at 3 per cent. as given at page 470, and also according to the Carlisle Table, Mr. Ansell's Table, and the Northampton Table.

| Age. | ENGLAND AND WALES.  |                    |                    |                                   | SCOTLAND.                         | Carlisle. | Ansell. | North-<br>ampton. | Age. |
|------|---------------------|--------------------|--------------------|-----------------------------------|-----------------------------------|-----------|---------|-------------------|------|
|      | Rural<br>Districts. | Town<br>Districts. | City<br>Districts. | Rural, Town, &<br>City Districts. | Rural, Town, &<br>City Districts. |           |         |                   |      |
| 20   | 22.78605            | 22.18086           | 21.29054           | 22.39981                          | 22.04167                          | 21.694    | 20.4602 | 18.6385           | 20   |
| 40   | 18.60452            | 17.01150           | 16.45861           | 17.90117                          | 17.56000                          | 17.143    | 15.6673 | 14.8476           | 40   |
| 60   | 11.85797            | 10.12786           | 10.18722           | 11.27757                          | 11.18877                          | 10.391    | 9.8583  | 9.7774            | 60   |

To those desirous of inquiring minutely into the relative values of Annuities for the different Tables given in this paper, and the Tables of Mortality hitherto in use, a careful consideration of their respective bearings will be important; for as Annuity Tables are the foundation on which all the subsequent Monetary Tables are built, their peculiarities must affect the whole structure. This will be clearly seen on inspection of the Table

for Deferred Annuities at page 471. According to that Table, at age 30 the value of a Deferred Annuity of £1 per annum, to commence forty years hence or on attaining age 70, is, for the Rural, Town, and City Districts, 1.13398, and the value of the same sum according to Mr. Ansell's Table is only .6764. This is a most remarkable distinction, and of vital importance to friendly societies; for although the present results for age 30 shew an excess of value in simple or Immediate Annuities of less than 13 per cent. above those given by Mr. Ansell, yet in the Deferred Annuity at the same age there is an excess of 69 per cent. It is under such circumstances as these, where the improvement of money at interest magnifies results, that serious blunders in the adoption of an erroneous Mortality Table will be apt to prove hurtful to the interests of a Society.

Few friendly societies granting Deferred Annuities have yet survived long enough to suffer from the effects of so serious an error; but the above illustration points out the inevitable ruin which must overtake those societies at present granting Deferred Annuities; as very few of them exact terms even so favourable as are required by Mr. Ansell's Tables. A further illustration of this question, and of the manner in which the peculiar result is produced, may be obtained by reference to Table F, page 32. It will be seen, that of 89,360 persons living aged 30, 42,367 attained their 70th year of age; that is to say, out of 100 entering a friendly society at 30 years of age, and purchasing Deferred Annuities, 47 would be alive at 70 years of age, to be placed on the Annuity List; but Mr. Ansell's Table would provide for only 33 of the 47 persons becoming Annuitants. Or more correctly, out of every 1000 members entering those societies at age 30, there would be 147 Annuitants unprovided for; that is to say, 45 per cent. more Annuitants would have claims, than would be calculated on by Mr. Ansell's data, who would therefore be left destitute of any provision for old age.

The melancholy spectacle which such a state of things would produce can be readily imagined. Supposing that at the present time there are only one million members of friendly societies, (which is much under the correct estimate,) whose average age is about 30, and presuming that the terms for Deferred Annuities are graduated according to the preceding hypothesis, 470,000 of those persons would attain the age of 70, and nearly one-third would be without any provision for old age. This is only one of the many evils connected with the present condition of friendly societies; and although its visitation be more remote, the awful consequences of such a calamity, like every other evil of procrastination, will be irreparable.

At page 472 will be found the value of Temporary Annuities to continue till age 70; and from what has been said respecting Immediate Annuities absolute for Life, and Deferred Annuities, it must be evident that Temporary Annuities will also partake of the same relative character as the other Annuity Tables referred to.

Since it has been shewn that, according to the results of this inquiry, Annuities are of greater value than that which is given in many other Tables, it must follow that the

value of Assurances, or sums payable at death, are of less value. An inspection of the Table at page 473 will shew that at age 30 the value of £100 payable at death is £35 14s. 6d. in the Rural Districts, £39 5s. 11d. in the Town Districts, £41 13s. 9d. in the City Districts, £37 8s. 4d. in the Three Districts combined, and £38 13s. 6d. according to the value of Life in Scotland; while, according to the Carlisle Table of Mortality, the value of the same sum would be £40 2s. 7d., by Mr. Ansell's Table £44 2s. 7d., and by the old Northampton Table as much as £47 16s.

Again: the annual premium at age 30 for an Assurance of £100 at death will, according to the Table at page 474, be £1 12s. 5d. for the Rural Districts, £1 17s. 9d. for the Town Districts, £2 1s. 8d. for the City Districts, £1 14s. 1d. for the Three Districts combined, and £1 16s. 9d. for Scotland; but the annual premium according to the Carlisle Table is £1 19s., by Mr. Ansell's Table £2 17s. 1d., and by the Northampton Table £2 13s. 4d. Nothing beyond the most general view of the various Tables is proposed to be here taken, as the remarks formerly made respecting the Tables of Mortality themselves will point out the various modifications which the results must undergo in their application to monetary purposes.

At page 475 will be found the Temporary Annual Premiums payable until age 70, to assure a sum payable at death, whenever that may happen, for each of the Districts. And at pages 476 and 477 will be found the probabilities of living for one year and of dying in one year for each District. As these form elements in the calculations of the rates or premiums for Allowances during Sickness, they are inserted simply as a check upon the calculations.

The next Table to be brought under notice is that at page 478, which represents the single premium necessary to provide an allowance of £1 per week during sickness or incapacity for labour up to the age of 70. All the Tables here given are meant to be illustrative of the true bearings and risks of friendly societies; and the age of 70 has been fixed on in the present instance, and in the other Tables of Temporary Premiums, because it is an age usually adopted in calculations for friendly societies, and will therefore admit of easy comparison with other results on the same subject.

As no attempt has been made in this paper to enter into the general principles of Vital Statistics, or to discuss the methods and formulæ most applicable to questions of Life Contingency, those desiring information on such points had better consult the standard works on the subject; but as the calculations in reference to the benefits offered by friendly societies are limited to the term of 70 years of age, and as it will be necessary in practice to have Tables for other terms of life, Tables in a different, and for many purposes a more convenient, form will be found in a subsequent page. However, it may be desirable for reference to give the formulæ by which the results at page 478 were obtained.

Let  $s$  = the average amount of sickness to each individual for the year immediately following any given age, as given in Table V ;

$v^{\frac{1}{2}}$  = the present value of £1 due six months hence ; and

Let  $s \times v^{\frac{1}{2}} = x$  ; also let

$p$  = the probability of a life of the given age living one year ; and

$v$  = the present value of £1 due one year hence ; and

Let  $p \times v = y$  ; then if

$z$  is made to represent the present value of £1 per week during sickness, from any given age up to an older age—say 70, the successive values for the  $z$  representing each age are found under the following expression:—

$$\lambda z_n = (\lambda z_{n-1} + \lambda y_n) + \lambda x_n$$

And if  $\theta$  is made to represent the terms at the respective ages in page 472,

$\lambda z_n - \lambda (1 + \theta)$  will give the logarithm of the annual premium for an allowance of £1 per week during sickness or incapacity for labour, as set forth in the Table at page 479. In that Table both the annual premium and the benefits are understood to cease on attaining 70 years of age, or sooner in the event of death.

The Tables referred to are calculated on the supposition that the various payments are to be made annually ; but it is well known that friendly societies rarely make any payments at so remote periods. For strictly practical purposes, Tables involving the consideration of annuities payable in monthly or weekly instalments would be better fitted ; but as the object of this paper is to furnish data illustrative of the condition of those societies, and of the nature and extent of the risks undertaken by them, as well as to give practical details for their guidance, further Tables have been inserted.

It is obvious from the remarks already made in regard to Table V, that the premium for an allowance in sickness, according to the results of this inquiry, must be higher than those of former Tables. As Mr. Ansell's information on this subject is the most deserving of attention, any comparison will be limited to the values given at pages 133 and 134 in his interesting treatise. At age 30 the value of £1 per week during sickness, up to attaining age 70, is £30.0958 ; but according to the results at page 478, it is £39.7176 for the Rural Districts ; £46.3904 for the Town Districts ; £40.8181 for the City Districts ; £41.6730 for the Rural, Town, and City Districts combined ; and £37.0322 for Scotland. These, although shewing a very great difference from the values given by Mr. Ansell, are still not greater than might be expected after a careful consideration of Table V, and the remarks made in the preceding pages on that Table. It has been stated that the values of annuities calculated from different mortality Tables will always shew less difference than the mortality Tables themselves ; but the same feature does not present itself in connection with sickness Tables. Two different Tables on the plan

of Table V might indicate precisely the same ratio of sickness at each age, and yet the value of a sick allowance calculated for the one Table might differ widely from that for the other.

In the annuity Tables two elements only affected the results—the rate of mortality and the rate of interest; but three elements affect the sickness Tables—the rate of mortality, the rate of interest, and the rate of sickness. It has been shewn that the rate of mortality does not necessarily increase with an increase in the rate of sickness; and therefore two classes of the population may be influenced by the same or nearly the same degree of sickness, and yet be subject to very different rates of mortality. Keeping this in view—suppose there are two sickness Tables, A and B, having the same or nearly the same rate of sickness at each age; but that the population of Table A is subject to a high rate of mortality compared to Table B,—it is evident, that although each individual of the same age in both Tables would in the course of the same year of life experience the same degree of sickness, yet each person under Table B would be subject to a greater amount of sickness over the whole duration of his life, and for the simple reason, that his expectation of life is greater. Take any number of persons—say 100, on the former Table at 30 years of age, and suppose their expectation, or for greater exactitude, their equation of life, to be 30 years; one-half only of those lives would live to attain 60 years of age; but if on the other Table the equation of life were 40 years, one-half of the same number would not be dead till 70 years of age, a considerable portion of which would be subject to an increased ratio of sickness in the decennial period following age 60. It happens that there is an actual case in point to illustrate this hypothesis. The Rural Districts of England and Wales, and the average results for all Scotland, shew almost exactly the same amount of sickness in the aggregate over the whole period of forty years from age 30 to 70, differing by less than two-tenths of a weeks' sickness; the amount in the

|                                                      |                |
|------------------------------------------------------|----------------|
| Rural Districts of England and Wales being . . . . . | 121·1448 weeks |
| And in the whole of Scotland . . . . .               | 121·3164 ...   |

But the equation of life for the former at age 30 will be found at page 100 to be 40·813 years, while for the latter it is only 37·478 years, being a difference of 3·335 years. And therefore, although there is no greater amount of sickness in the Rural Districts of England and Wales than in Scotland generally, still the value of a sick allowance in the former is greater than in the latter. At page 478 it will be found that at age 30, the single premium for a sickness allowance of £1 per week, to cease at age 70, is in the

|                                                |                   |
|------------------------------------------------|-------------------|
| Rural Districts of England and Wales . . . . . | £39·7176; but for |
| The whole of Scotland only . . . . .           | £37·0322          |

It is therefore evident that the rate of sickness is not of itself a sufficient index to the rates

of premium that may be deduced therefrom. At page 415 it was shewn that the excess of sickness in the present results above those quoted by Mr. Ansell was 21 per cent., but the values for sick allowance, quoted in the preceding page, shew a difference of above 31 per cent. The feature, therefore, which was characteristic of annuity Tables—of approximating nearer to equivalent values than the mortality Tables from which they were deduced—does obviously not distinguish sick allowance Tables.

There is another feature connected with Tables of the rates of sickness, which will affect their money-values, independently of the influence of the rates of mortality, and that is the graduation or distribution of sickness over the various periods of life. It might happen that two sickness Tables gave the same amount of sickness within a given period of years, but that in the one Table it was more uniformly spread over the various terms of life; not shewing, as in the other Table, a very low rate of sickness at the younger ages, and a very high rate at advanced ages. This circumstance, although the rate of mortality in both Tables were the same, would occasion a difference in the value of sick allowances—and for two reasons; first, because the bulk of the sickness in the one Table was deferred till the advanced ages, those persons dying before reaching those ages would experience a minimum amount; and second, because the money liabilities also being deferred, the early premiums would by longer investment accumulate to a greater sum. An inspection of the second Abstract, given on page 413 and the Table on page 415, will shew that such a relation exists between Mr. Ansell's Table and the general results of this inquiry; the sickness in his Table being more uniform, and shewing less disparity for the various ages, while the Highland Society Table runs almost parallel over the whole term of life, from 20 to 70 years of age, with the results for the three Districts.

The following Abstract will shew the comparative values of an allowance of £1 per week in sickness up till age 70:—

| Age. | Mr. Ansell's Table. | ENGLAND AND WALES. |                 |                 |                           | SCOTLAND.                 | Age. |
|------|---------------------|--------------------|-----------------|-----------------|---------------------------|---------------------------|------|
|      |                     | Rural Districts.   | Town Districts. | City Districts. | Three Districts combined. | Three Districts combined. |      |
| 20   | 27·0881             | 34·68519           | 39·80233        | 35·41518        | 36·20420                  | 32·7979                   | 20   |
| 30   | 30·0958             | 39·71760           | 46·39042        | 40·81807        | 41·67304                  | 37·0322                   | 30   |
| 40   | 34·3204             | 46·56296           | 55·56052        | 46·00568        | 48·83092                  | 44·1712                   | 40   |
| 50   | 38·7078             | 53·45831           | 62·31153        | 50·16440        | 55·28222                  | 51·8728                   | 50   |
| 60   | 39·2316             | 55·15634           | 61·85428        | 42·69764        | 55·23260                  | 51·5541                   | 60   |

The important effect of the above differences on the stability and permanence of a society is obvious. The distinction which has been observed in respect of single payments or premiums, will also be found to prevail in the annual premiums, as given at page 479: and the following Abstract will give a general idea of the merits of the various Tables.

The annual premium, as well as the sick allowance, will in this case also terminate on attaining 70 years of age.

| Age. | Mr. Ansell's Table. | ENGLAND AND WALES. |                 |                 |                           | SCOTLAND.                 | Age. |

The preceding observations will be sufficient to point out the leading features of the sickness Tables, and to suggest the proper modes of application to the practical uses of friendly societies. It is not expected that the present paper will obtain anything like a general circulation among the members of those societies, or a different style and mode of treating the subject would have been adopted. All that has been contemplated is such an exhibition of the facts and data as will afford a means of determining the various contingent risks on which the liabilities of friendly societies depend in such a manner as to be intelligible to those taking an interest in vital statistics; but as, in addition to the prizes given, as mentioned at page 17, a further inducement was held out to parties furnishing data, by a promise to publish the results, and present copies to every contributor of data; the following remarks were added bearing on the present condition of friendly societies.

One of the difficulties in the way of obtaining information was the fear, on the part of the members, that its publication might prove hurtful to particular societies; and it was therefore necessary to promise, that whatever use was made of the information, no individual society should be referred to. But that a general idea may be formed of the condition of friendly societies, in respect to the adequacy of their contributions for the benefits held out by them, fifty societies have been selected at random; and in order to make the illustration more simple, one period of life only, age 35, has been fixed on, and the rates in each of the fifty societies in question examined and graduated to represent an allowance of £1 per week during sickness, up to age 70—an annuity of £13 per annum for life after 70—and a sum of £10 payable at death, whenever that may happen. The corresponding rates having been determined in each society for the above scale, they were found to average only £1 11s. 5d.; but in many of the societies an entry money is paid, and for the same age it was found to average £1 1s. 9d. As the value of the temporary annuity at the same time of life is 17.88172, the above entry money will be equivalent to an annual contribution of about 1s. 3d., which, added to the other item, will render the

whole annual contribution £1 12s. 8d. The entire inadequacy of such a contribution to provide for the benefits offered must be apparent. Page 479 will shew, that for the single benefit of £1 weekly, during sickness, the annual contribution should be £2 7s. 9½d.; and on examination of the respective Tables it will be seen that the contribution adequate to provide for the three benefits offered is £3 7s. annually, or more than double the actual amount collected. This is a most lamentable condition in which to find societies aiming at designs so benevolent and praiseworthy. It may seem strange that they should endure for even a year or two; but if the amount of sickness at page 415 be examined, and the young period of life at which members generally enter be borne in mind, it will appear that they may survive at least 25 or 30 years before their insecurity becomes evident to an ordinary observer. Members are generally satisfied, in the first periods of a society, to find that the income has exceeded the expenditure and left a respectable balance, losing sight of the great accumulations which are necessary to meet the future liabilities incidental to their increasing years and infirmities. As a society advances, its income, in connection with a given number of members entering at a particular age, will invariably decrease with the increase of its expenditure. Suppose a society to commence with a given number of members, all 35 years of age; in 25 years afterwards, the income from those members, through the deaths that take place in that period, will have decreased to seven-tenths of its original amount; while its expenditure on sickness will have tripled, and the members will be fast approaching a time of life at which the expenditure will be ten times the original sum. This is a state of things for which the contributions of a society should make ample provision; but, unfortunately, few have so considered the subject as to prepare themselves for such vicissitudes.

But perhaps the most simple and correct mode of looking at the liabilities of those societies is to consider the most improved class of them, in which separate contributions are made for each benefit offered; and in this instance also the contributions answering to age 35 only will be spoken of.

No doubt societies may seriously err by having badly graduated Tables; and it might happen that the contributions at one period of life are abundant, while at other periods they may be quite inadequate; but as a very general view only is to be here taken of the subject, reference is made to the Tables themselves for information on the graduation of rates.

A distinction in the contributions for the various benefits offered, is a valuable improvement in the management of such societies; and accordingly collateral improvements accompany it; for in this class of societies it is found that the annual contribution for a sickness benefit only is nearly equal to that of the other group of societies referred to for the whole three benefits. To secure £1 per week during sickness, the contribution is £1 10s. 10d. yearly, which is only 1s. 10d. less than the yearly contribution in the other societies for all the benefits combined; but it has already been shewn, that the real

risk incurred from sickness by members entering at age 35, would require a payment of £2 7s. 9½d. annually.

No doubt many societies are on a much better foundation than the above statement would seem to indicate; but it has been thought the better course to refer to the societies as a class. A subdivision, however, of the same group was found in a better condition, and the annual payment was about £2 for £1 per week in sickness. No society had its sickness contributions equal to the rates in the preceding Table; but the payments in one society were much more than in the others, having been £2 6s. 11d. annually. The necessity for a general revision of the sickness rates and contributions in friendly societies is therefore obvious.

With respect, however, to those societies distinguishing the rates of contributions for sums of money payable at death, or what is generally termed assurances at death, a better state of things is found to exist. The contribution, on the average, of those societies is 4s. 7d. annually for £10 payable at death, while the exact risk, according to page 474, requires a payment of 4s. 0½d. This latter sum does not include anything for expenses of management. If it were the practice for those societies to keep distinct funds for each of the benefits offered, and never to allow the contributions for assurances at death to be mixed up with the monies arising from other sources, little danger need be feared by those making a provision for death; but, unfortunately, such a separation of the funds is rarely observed, and the general result is, that the assurance fund is absorbed by the deficiencies in the other business of the society. It may be here necessary to remark, that although the preceding sum is, on the average, quite adequate to meet the contingencies from death of all societies, yet there are societies in particular localities, the members of which follow unhealthy occupations, and, in those instances, such a sum would not be sufficient to meet all the liabilities from death.

The most remarkable deficiency yet observed, even among those societies that have graduated rates as well as distinct contributions for the various benefits offered, is in the contributions which provide for an annuity after attaining a given age. At page 471 will be found the values of deferred annuities, to commence at age 70; and the annual premium for the same annuity may easily be obtained from the expression—

$$\frac{\delta}{1 + \theta}$$

in which  $\delta$  represents the terms found at the respective ages on page 471, and  $\theta$  the corresponding terms in the Table on page 472. Accordingly, at age 35, the annual contribution or premium for an annuity of £13 a-year after attaining the age of 70 is 18s. 10d.; but the rate in some societies is as low as 8s. 11d., and an average of a number of the best societies is 12s. 2½d., while the most favourable rate in any individual society, in the

same group, was 14s. 4½d. The nature of this risk has already been referred to at page 484, and the remarks there made should be carefully considered by every one interested in the progress of friendly societies, as no error carries with it such distressing and melancholy consequences as that which aggravates the cares, anxieties, and infirmities of old age, and in the decline of life leaves those destitute whose youthful industry enabled them to live in comparative independence.

Another feature which particularly marks the older class of friendly societies, and which deserves attention, is a want of graduation in the premiums or rates of contribution. This feature, although generally associated with inadequate rates, is not of itself evidence of instability, but is rather a principle which is non-equitable to the members. The better constituted friendly societies have long discontinued such a plan, and have now Tables graduated according to age; but as there are still many societies not so improved, it is proposed to add a few observations on the nature of this error, which is most strikingly developed in the management of Odd Fellow Societies.

For example, one member with another, in passing from 20 to 30 years of age, will experience about 8½ weeks' sickness during the ten years, but in passing from 60 to 70 years of age, he will be subject to above 77 weeks' sickness, and in the ten years immediately following age 70, he would experience 205 weeks' sickness. This gradual increase of sickness with an increase of age, cannot fail to demonstrate that it would be anything but equitable to admit members at every period of life on the same terms. Viewed as a money question, it will be seen, (Table A Q) that at age 20, the sum of £36 4s. 1d., paid down, would provide £1 a-week during sickness up till age 70, but that, at age 40, £48 16s. 7½d. would be necessary; and, therefore, if it were the practice of lodges to admit members at those ages, on equal terms, the older members must be supported, to a great extent, at the expense of the younger. A similar relation will be found to prevail with regard to the provisions for allowances at death.

If the money values for the preceding benefits were determined according to the experience of the members of the Manchester Unity itself, they will be found not to differ very widely. It has already been stated with regret, that Mr. Ratcliffe, in calculating his monetary tables, employed the Odd Fellow data beyond the age of 65, though they were evidently defective subsequent to that age, from the very small number of persons over whom the observations were made: and as the data for the twenty years preceding that period, approximate in a very remarkable manner to the results in these Contributions, there is every reason to believe, that if after the age of 65, the data of the Odd Fellows' experience had been sufficiently ample, an equally close approximation would have shewn itself. At all events the data in this Work, in the advanced stage of life, being of forty times the magnitude, should, seeing that the other is obviously defective, be used in preference. In constructing the following Tables, therefore, to

determine the money values for the different benefits described, the rate of sickness as actually experienced by the Unity, between ages 40-65, is taken from Mr. Ratcliffe's Table VII, page 19, and, subsequent to that age, from Table E, pp. 26-7 *ante*. Again, under the age of 40, the somewhat reduced ratio of sickness shewn in the returns of the Unity, must, on a careful consideration of the preceding remarks, be regarded as a temporary feature connected with the experience of the Order, as there are the strongest reasons to believe that should the different lodges become more stable, and cease to be agitated by the questions which have caused so much discussion during the last five or six years, the diminished fluctuation of members, at the younger ages, must have the effect of producing a higher ratio of sickness at the earlier periods of life, equalling, if not exceeding, that shewn in Table E. Hence, in constructing the following Table A U, the ratio of sickness for ages under 40 are the same as in Table E. There is, however, another element which enters into the consideration of this Table, viz. the rate of mortality. By the following Abstract it will be seen that the rate of mortality among the members of the Unity is intermediate between that for the whole population of England and Wales, and that for friendly societies in general. The following are the results for the different classes:—

| Age.      | Mortality per Cent. deduced from the data for      |                                            |                                 |
|-----------|----------------------------------------------------|--------------------------------------------|---------------------------------|
|           | England and Wales<br>whole population,<br>Table C. | Manchester Unity,<br>Ratcliffe, pp. 19—20. | Friendly Societies,<br>Table F. |
| 21 to 25  | ·876                                               | ·7561                                      | ·6838                           |
| 26 ... 30 | ·998                                               | ·8058                                      | ·7295                           |
| 31 ... 35 | 1·063                                              | ·8788                                      | ·7966                           |
| 36 ... 40 | 1·157                                              | ·9340                                      | ·8786                           |
| 41 ... 45 | 1·319                                              | 1·2259                                     | 1·0287                          |
| 46 ... 50 | 1·560                                              | 1·4818                                     | 1·2571                          |
| 51 ... 55 | 1·935                                              | 2·1849                                     | 1·6812                          |
| 56 ... 60 | 2·529                                              | 2·8282                                     | 2·2249                          |
| 61 ... 65 | 3·474                                              | 4·5826                                     | 2·9262                          |
| 66 ... 70 | 4·947                                              | 6·8571                                     | 4·4885                          |
| 71 ... 75 | 7·243                                              | 6·7961                                     | 7·0928                          |
| 76 ... 80 | 10·924                                             | 9·5237                                     | 8·5140                          |
| 81 ... 85 | 16·206                                             | 12·5000                                    | 12·5874                         |

From the above Abstract it will be seen that the rate of mortality under the age of 50 is, in the Manchester Unity, intermediate between the two other classes, but from that age to 70, the rate is higher; it consequently follows that, so far as the experience of the Unity extends, the members are subject to a rate of mortality differing from the other two. It has already been stated that, after the age of 65, the Odd-Fellow data is too limited to be relied on in regard to sickness, and the same observation applies with greater force in respect to mortality.

In constructing the following Table, therefore, the actual rate of mortality observed in the Manchester Unity, up to the age of 65, will be taken, but, after that age, a rate intermediate between the other two classes of results.

It is unnecessary here to enter into the details of the method followed in order to determine from the preceding facts the rates of mortality and sickness for specific ages, and to construct the preliminary Tables thence arising, preparatory to the formation of the following Table. Those wishing to follow up that part of the question, will find the methods fully explained and exemplified in the Contribution on the Rate of Mortality among Persons of Intemperate Habits, pp. 206-17 *ante*.

TABLE A U.

| Age. | D.    | N.      | D <sup>s</sup> | N <sup>s</sup> | Age. | D.     | N.      | D <sup>s</sup> | N <sup>s</sup> |

Column D of the preceding Table has been formed from the expression  $l_m v^m$ , in which  $l_m$  represents the numbers living at the age  $m$ , according to the actual experience of the Order, and  $v^m$  represents the present value of £1 due at the end of  $m$  years at 3 per cent.: also,

$$D_m = \text{quantity in col. D at any given age } m; \text{ and}$$

$$D_{m+x} = \dots \dots \dots \text{at any variable higher age } m+x.$$

And in the same Table  $N_m = \Sigma D_m + 1$ .

The columns  $D^s$  and  $N^s$  are formed on a similar principle:—

Let  $s_m$  = the amount of sickness annually to each person, aged  $m$ , expressed in weeks;

$$\text{And } z_m = s_m v^{\frac{1}{2}}$$

$$\text{Then, as } D_m = l_m v^m$$

$$\therefore D_m^s = D_m z_m$$

$$\text{And } N_m^s = \Sigma D_m^s$$

The following three Tables contain a condensed Abstract of the monetary values deduced from Table A U, which represents the experience of the Order in accordance with actual observation.

TABLE A V.

*Value of an Annuity of £1 yearly, calculated from the actual experience of the Order.*

| Age. | Immediate Annuity for the whole of life. | Deferred Annuity to commence at age 70. | Temporary Annuity to continue till age 70. |
|------|------------------------------------------|-----------------------------------------|--------------------------------------------|

| 40   | 47·5718 = 47 11 5½                          | 2·89574 = 2 17 11                       |  | 79·8969 = 79 17 11½                                   | 4·44959 = 4 8 11¾                      |  |
| 50   | 55·8715 = 55 17 5½                          | 4·52022 = 4 10 5                        |  | 105·3538 = 105 7 1                                    | 7·16721 = 7 3 4½                       |  |
| 60   | 50·3825 = 50 7 7¾                           | 6·85978 = 6 17 2½                       |  | 134·7038 = 134 14 1                                   | 11·88803 = 11 17 9½                    |  |

The formula for the construction of Tables A V and A W will be found in all the recently published works on Life Annuities, and the results given in Table A X may be easily determined from Table A U, as follows:—

$$\frac{N_m^s}{D_m} = \text{Results in column No. 4, Table A X.}$$

$$\frac{N_m^s}{N_{m-1}^s} = \text{Do. Do. No. 5, ...}$$

$$\frac{N_m^s - N_{m+n}^s}{D_m} = \text{Do. Do. No. 2, ...}$$

$$\frac{N_m^s - N_{m+n}^s}{N_{m-1}^s - N_{m+n-1}^s} = \text{Do. Do. No. 3, ...}$$

To avoid further argument on the subject, it will be assumed in the future pages of this paper that rates graduated to lower terms than set forth in the preceding Tables would be unsafe for the guidance of the Order. Complete evidence of this is furnished in the analysis of the facts and elementary data on which the calculations are founded; and the inherent evidence in the various parts of this paper amply demonstrate that the liabilities of the Order have been hitherto quite equal to those anticipated in these calculations. It therefore remains to determine whether the contributions exacted by the Order are such as are calculated to maintain the stability of the Institution, and realise the benefits promised to the members. It may be also as well to mention, that in the discussion of this point no statement will be advanced for which facts and examples both in and out of the Order do not exist. This is believed to be the only satisfactory mode of treating such a question. Unless ample data be available, it is impossible to measure the liabilities; but with sufficient data, it becomes a matter of certainty and of simple calculation, and the province of mere opinion is ceded to positive evidence, to which all must submit who can comprehend the argument.

It is not thought necessary to refer at this place to the rates and contributions hitherto demanded by the various lodges in the Unity, but to take up the question as to whether the scales drawn up by the Board of Directors at Manchester, and proposed some time since by the Glasgow A. M. C., are safe, and calculated to meet all the liabilities of the Order. Any arguments used in reference to those scales, whether in favour of their adoption or otherwise, will apply with greater or less force to the present rates of any particular lodge, according as they are greater or less than those of the proposed scale. This course is inevitable, as it is impossible to discuss the rules of each lodge *seriatim*.

In the Manchester Unity, during the year 1844, the total number of weeks' sickness experienced by the members was 226917, and the amount of money paid to sick members was £107,440 8s. 11d.: it hence follows that for each weeks' sickness there was paid about 9s. 6d. As a standard of comparison it may therefore be assumed that the general practice of the Unity is to pay 10s. per week in sickness, and we shall test the accuracy of the proposed scales on this ratio. Some lodges no doubt pay more, and others less, to their members, than the above average: but if the terms are calculated for 10s. per week, it will then be easy to determine the rate for any other particular scale of payment.

In the first instance reference will be made to scale No. 1, or manufacturing class, as prepared by the Board of Directors, and recommended to be adopted. The average age of the members of the Unity was stated to be then 32 years; and making that the point of comparison, it will be found that a weekly payment of 5d. by the members is to provide for them the following benefits, viz.:

|     |    |   |                                  |
|-----|----|---|----------------------------------|
| £0  | 10 | 0 | per week during sickness,        |
| £10 | 0  | 0 | at the death of a member, and    |
| £5  | 0  | 0 | at the death of a member's wife. |

But it will also be found that in addition to the 5*d.* per week, each member has paid entrance money, which for age 32 is equivalent to an annual payment of 1*s.* 1*d.* A payment of 5*d.* weekly is equal to a yearly sum of £1 1*s.* 8*d.*; and to this add 1*s.* 1*d.*, and the full yearly payment will be £1 2*s.* 9*d.*

Let us next determine how far this payment is calculated to meet the liabilities of the Order, according to the data already alluded to.

|                                                                     |    |    |    |
|---------------------------------------------------------------------|----|----|----|
| On reference to Table A S, it will be found that the annual pay-    | £  | s. | d. |
| ment at age 32 for an allowance of 10 <i>s.</i> per week during     |    |    |    |
| sickness, to continue to the extreme of life, is . . . . .          | 1  | 14 | 4½ |
| For £10 at death of a member, age 32, Table A M . . . . .           | 0  | 3  | 8½ |
| To provide £5 at the death of a member's wife, (the deaths being    |    |    |    |
| in the ratio of 1650 to 2286 of the members themselves—see          |    |    |    |
| Table A Y), the payment will be . . . . .                           | 0  | 1  | 4  |
| Total payment required for the three benefits promised by the Order | £1 | 19 | 5  |

The payment necessary to provide for the benefits promised will thus be seen to amount to £1 19*s.* 5*d.* to each member yearly, but the actual sum demanded according to the new scale, No. 1, is only £1 2*s.* 9*d.*, being about 42 per cent. less than the terms necessary to enable the Unity to meet its engagement. It should be kept in view that in the preceding calculation nothing is allowed for expenses of management, so that the sum of £1 19*s.* 5*d.* is absolutely necessary to meet the various liabilities without any deductions whatever.

Again: according to Table A U preceding, constructed on the actual experience of the Order, the following are the rates necessary to provide the same benefits, viz.:—

|                                                                      |   |    |       |
|----------------------------------------------------------------------|---|----|-------|
| Yearly payment required at age 32, on account of an allowance of     |   |    |       |
| 10 <i>s.</i> per week during sickness, to continue to the extreme of |   |    |       |
| life, is, according to Table A X, preceding . . . . .                | = | £1 | 12 5½ |
| For £10 at death of a member at age 32, Table A W . . . . .          | = | 0  | 4 1   |
| To provide £5 at the death of a member's wife (the deaths being      |   |    |       |
| in the ratio of 1650 to 2286 of members themselves—see               |   |    |       |
| Table A Y) . . . . .                                                 | = | 0  | 1 5½  |
| Total payment required for the three benefits promised by the        |   |    |       |
| Order, and according to the data derived from the experience         |   |    |       |
| of the Unity . . . . .                                               | = | £1 | 18 0  |

This result is of vital importance, and should receive the immediate and earnest attention of the members. It is believed that the form in which the present evidence is

given, will enable any one of ordinary intelligence to test all the figures, and thoroughly satisfy his own mind of the perilous condition in which the Order is at present placed.

From a succeeding Table, A Y, it will be seen that the annual income of the Order, under the head of contributions, is £245,842 13s. 8d., and, according to the preceding figures, there would still be an annual deficiency of no less than £209,688 11s. 10d. The awful calamity which must await the Order under such circumstances cannot fail to alarm the members as to the terrible consequences which must inevitably follow their neglect or indifference in carrying out the radical reforms necessary in their constitution. Truly, in such an event, the sins of the fathers will be visited on the third and fourth generations. A quarter of a million of men have now the opportunity of perpetuating one of the most useful institutions ever developed by the working classes of any country. Under proper regulations, it may be the direct means of elevating the moral and physical condition of a vast body of the rising generation, and imparting a social character and importance to the industrious and provident classes which they have never yet acquired; but, to participate in those advantages, it is absolutely necessary that a great movement should be made towards financial reform in the institution. Let, therefore, every member say to himself, "I will put my shoulder to the wheel,—I will make an effort, which I am certain is quite within my power,—I will do that, as an individual, which others have done in smaller institutions, and which is only just and equitable,—I will listen to the warning which science and experience set before me, and I shall then have the satisfaction of believing that I have done the best that could be done; I shall feel convinced, that with good and economical management, our institution will survive and prosper,—it will really and truly be the support of my declining years; when the infirmities of old age creep upon me, I shall have the consolation of falling back on the industrious savings of vigorous youth. My family will be induced to follow my example. With my friends and neighbours all petty jealousies will be set aside,—we shall unite in promoting our own and our children's welfare; and while we profess to unite in the bonds of true fellowship, let us honestly exclaim—

" Two are better than one;  
If they fall, the one will lift up his fellow;  
But woe to him that is alone when he falleth,  
For he hath not another to help him up."

Again: as it has been shewn that the proposed scale, No. 1, would occasion an annual deficiency in the income of £209,688 11s. 10d., the following figures will point out what amount of contribution would be required at the present moment to make up that deficiency.

The present value of an annuity on a life of 32 is 19.98129 (see Table A H), or nearly 20 years' purchase; so that if the contributions were to continue on the scale now proposed,

each member would need to pay down at present the sum of £16 9s. 8d. (16·984), to make up future deficiencies in his annual payments.

But as there were 251727 members in the Unity in January 1845, these two items multiplied together will produce the sum of £4,275,181. From this subtract £700,000, the capital stock of the Order at the same period, and £3,575,181 will be the payment that should be made in order to place Odd Fellows on a secure foundation, with their proposed scale of contributions.

The members, however, must keep in view that should no such donation be now made to the society, then the ultimate deficiency under their proposed rates will be much more than £3,575,181; for in order to enable that sum to meet all the demands on the society it should be invested to yield 3 per cent. compound interest. As there is no chance, however, of any such donation, the ultimate deficiency will be about ten millions.

But there is another, and perhaps a simpler mode by which members may satisfy themselves of the inadequacy of the proposed scales. On referring to Table V, page 409 of this Contribution, it will be found that at age 32, which is the average age of members in the Unity, the amount of sickness per annum to each is ·9250 weeks, or 6 days 11 hours to each member; and as, over the whole Unity, the payment for a week's sickness is 9s. 6d., that will average to each member yearly 8s. 9½d., but by Table V it will be seen that the actual expenditure on sickness during 1844, was 8s. 10¼d. to each member. We have, therefore, so far a most satisfactory confirmation that the data of these Contributions is applicable to the Order; and carrying out the reasonings on the same basis, it will follow that at the present time there should be an annual saving on the income of each member's contributions for sickness alone of £1 5s. 1d.; but the actual saving on this item was only about 11s. 4d., and on the total income of all the Lodges there was a saving to each member during the same year of about 26 per cent. only; while under a proper graduation of the contributions, the saving would have been at least 75 per cent., or three times the actual amount. To this it may be replied, that the illustration may faithfully represent the former condition of the Unity, but it is not applicable to the new scale. An inspection, however, of Table A Y will shew that during the year 1844, the receipts from each member over the whole Unity, in the shape of contributions, was about £1 0s. 2½d., while the amount proposed to be levied under scale No. 1, is £1 1s. 8d. for 10s. weekly during sickness, and the collateral benefits; but as the average sick allowance in 1844 was only 9s. 6d. per week, the corresponding contribution for the full benefits of scale No. 1, would be £1 1s. 3d. yearly, differing only by 5d. from the terms of the proposed scale. It is, consequently, evident that the preceding arguments, drawn from the past experience of the Order, are equally applicable to the proposed scale of payments.

It will thus be seen that the proposed scale No. 1, instead of demanding an increased rate of contributions from the members, is just leaving them in the same position in which they were placed during 1844. The effect of that scale is not to increase the income of

the Order, but to produce an uniformity between the income and expenditure of the various lodges. From the violent opposition offered to its adoption, the innumerable dissensions and bickerings, and the many angry discussions to which the proposal has given birth, there can be no doubt that the popular belief is, that the tendency of the proposed scale is to increase the payments by members. It is also evident that the intention of the Glasgow A. M. C. and the Board of Directors at Manchester, was to augment the amount of the contributions; and that they have not done so, can only have arisen from their own ignorance of what was the condition of the various lodges at the period referred to. The following analysis of the money condition of the Order during 1844 will, however, set the question at rest, and enable any one to prove the above facts for himself. It may also be stated that the classification adopted is identical with that set forth in Table A Z, page 506 of this Contribution.

TABLE A Y.

*Income and Expenditure of the Manchester Unity during the Year 1844.*

| Districts.         | Number of Members, Jan. 1, 1844. | Average No. of Members during 1845. | Income from    |    |    |              |    |    |                   |    |    | Expenditure on |    |    |               |    |    |           |    |    |
|--------------------|----------------------------------|-------------------------------------|----------------|----|----|--------------|----|----|-------------------|----|----|----------------|----|----|---------------|----|----|-----------|----|----|
|                    |                                  |                                     | Contributions. |    |    | Initiations. |    |    | Fines, Goods, &c. |    |    | Sickness.      |    |    | Funerals, &c. |    |    | Sundries. |    |    |
|                    |                                  |                                     | £              | s. | d. | £            | s. | d. | £                 | s. | d. | £              | s. | d. | £             | s. | d. | £         | s. | d. |
| Rural .            | 68553                            | 66208                               | 62072          | 5  | 0  | 10544        | 19 | 2  | 7875              | 2  | 3  | 26849          | 3  | 4  | 14697         | 6  | 2  | 16303     | 1  | 6  |
| Town .             | 79790                            | 77070                               | 74959          | 4  | 11 | 14295        | 18 | 10 | 9429              | 1  | 0  | 32617          | 3  | 8  | 19342         | 10 | 11 | 21637     | 1  | 8  |
| City .             | 103384                           | 99848                               | 108811         | 3  | 9  | 24541        | 11 | 1  | 12671             | 5  | 1  | 47974          | 1  | 11 | 28702         | 14 | 5  | 33480     | 13 | 2  |
| Whole }<br>Unity } | 251727                           | 243126                              | 245842         | 13 | 8  | 49382        | 9  | 1  | 29975             | 8  | 4  | 107440         | 8  | 11 | 62742         | 11 | 6  | 71420     | 16 | 4  |

The above Table furnishes the details of Income and Expenditure for the Rural, Town, and City Districts separately; but the remarks will, in the first place, be confined to the results for the whole Unity.

The following is the Income and Expenditure for the whole Order during the year 1844:—

|                                           | <i>Income.</i> | £        | s. | d. |
|-------------------------------------------|----------------|----------|----|----|
| From Contributions . . . . .              |                | 245,842  | 13 | 8  |
| ... Initiations, or Entry Money . . . . . |                | 49,382   | 9  | 1  |
| ... Fines, Goods, and Sundries . . . . .  |                | 29,975   | 8  | 4  |
| Total Income during 1844 . . . . .        |                | £325,200 | 11 | 1  |

|                                                          | <i>Expenditure.</i> | £       | s. | d. |
|----------------------------------------------------------|---------------------|---------|----|----|
| Paid to Sick Members . . . . .                           |                     | 107,440 | 8  | 11 |
| ... For Funerals, District and Widow and Orphan's Fund . |                     | 62,742  | 11 | 6  |
| ... For Sundries . . . . .                               |                     | 71,420  | 16 | 4  |

Total Expenditure during 1844 . . . . . £241,603 16 9

Surplus of Income over Expenditure for the year 1844. £83,596 14 4

Or an annual saving to each member of about 6s. 10½d.

The following will give an idea of the expenses of management of the Order:—

|                                                                    |              |
|--------------------------------------------------------------------|--------------|
| Ratio of Expenses of Management to the whole Expenditure . . . . . | 29 per cent. |
| ... to the amount paid to Sick Members . . . . .                   | 66 ...       |
| ... to the amount paid for Funerals . . . . .                      | 113 ...      |
| ... to the Income from Contributions . . . . .                     | 29 ...       |
| ... to the Total Income . . . . .                                  | 22 ...       |

It is evident that if such an application of the funds be permitted to continue, the dissolution of the Order must be fast approaching. The Directors of the Unity are therefore most imperatively called on to interpose their influence to prevent such a lavish expenditure on the part of the lodges. It will be seen that it is not to one year alone that this enormous outlay is confined, but must have been peculiar to the whole history of the Order. In 1834 the number of members was about 60,000, and at the beginning of the present year the number was 251,727—increase about 19,000 per annum; but in connection with this, a remarkable fact deserving of serious consideration is brought to light by the Directors. They state that “the amount of initiation-money which was received from members in 1844, being no less a sum than £49,382, it will be discovered, on reference to the list of lodges, that our increase of members in that year was only 21,461, and by these returns it is clearly proved that upwards of 40,000 members were initiated in 1844; thereby at once affirming that upwards of 20,000 members left the Order in one year, after paying their initiation-money and contributions for a length of time. We are of opinion that the particular attention of the members of the Order should be drawn to this important fact, with a view of arriving at the true cause why so many leave the Order.” At this rate the total amount of initiation-money received by the Order ought in January 1845 to have realised a capital of £750,000 at least, without any augmentations from other contributions; but it is understood that the whole capital at that time did not exceed £700,000: so that the Unity now finds itself in this position, that they have been proceeding on a plan, by which the contributions are not sufficient to meet the current expenditure, and that they have been actually falling back on the initiation-money of the members. Further argument is not needed to shew the insecurity of any institution when based on such a system. And it ought to be kept in view that

this state of things prevails when the bulk of the members must be very young, and are represented at an average age of 32—a period of life at which the rate of sickness is not equal to one week per annum to each person. Where then is the boasted provision so loudly proclaimed by some to meet the vicissitudes and infirmities of after life, when the rate of sickness per annum will be from 10 to 20 weeks to each member? It is astonishing that people can be so blind to their own interest, and not see the awful calamity which awaits them unless decided improvements are effected in the condition of the Order. In Manchester, the fountain-head of the Unity, the greatest possible opposition has been given to the recent changes suggested by the A. M. C., and carried out by the G. M. and Board of Directors. The most angry and violent manifestation of feeling has evinced itself, threatening dangerous and fearful consequences to the whole Order; and yet in the same district, palpable and obvious examples are to be found of its utter inability to survive long under such a deplorable condition.

In Manchester itself there are 6 lodges established on an average of 11 years; and on the 1st of January 1845, they contained 530 members, and were possessed of funds—to what amount will it be believed possible?—why the lamentably small sum of £91 13s. 6d., or less than one-twelfth of the entrance money which must have been paid into the lodges. Again: there are 12 other lodges, established for an average period of 4½ years, and containing 613 members and their total amount of funds is £313 15s. only. And further: of 33 lodges which have been open for an average period of twelve years, but recently suspended, and which contain 2,774 members, the gross amount of funds they possessed on the 1st of January, 1845, was only £1,379 6s. 6d., or not one-half of the initiation-money paid into the lodges. Yet, with such striking and obvious signs of decay, the Board of Directors are forced to contend against the most ill-conceived opposition. No one with his eyes open can fail to see that the Unity has arrived at that period of its history when its income must of necessity be unable to meet the required expenditure. Out of 100 lodges, containing 11,080 members, the whole of their accumulated capital did not amount to 13s. per member.

It really seems surprising that any evidence beyond this should be wanting to bring conviction to the minds of Odd Fellows, of the urgent need of immediate reform. In some lodges the expense of management absolutely exceeds the amount paid for sick allowance; and in many instances amounts to a sum varying from 8s. to 13s. yearly, to each member; while in others more than half the original contributions are squandered away in the modes of management adopted; and in one district, among 2800 members, the expense of management during the year was about £1100. Nothing could stand this long, even though the rates and contributions were otherwise well graduated. Take the following as an example of the reckless expenditure indulged in by some lodges. That it may not be thought an isolated instance, but of serious and fearful importance, it is only right to mention that the following figures shew the income and expenditure of 14

different districts, containing 297 lodges and 17,059 members, and therefore to be considered by all well-wishers of the Order as demanding immediate redress.

| <i>Income.</i>                                           |  | £       | s. | d. |
|----------------------------------------------------------|--|---------|----|----|
| Amount of Contributions received . . . . .               |  | 21,402  | 15 | 7  |
| Amount of Initiations . . . . .                          |  | 12,436  | 16 | 7  |
| Amount of Fines, Goods, Sundries . . . . .               |  | 3,712   | 4  | 9  |
| Total Income during 1844 . . . . .                       |  | £37,550 | 15 | 11 |
| <i>Expenditure.</i>                                      |  | £       | s. | d. |
| Amount paid to Sick Members . . . . .                    |  | 6,998   | 18 | 3  |
| ... for Funerals, Districts, and Widow and Orphan Funds  |  | 7,566   | 2  | 4  |
| ... for Sundries . . . . .                               |  | 10,497  | 12 | 9  |
| Total Expenditure for 1844 . . . . .                     |  | £25,062 | 13 | 6  |
| Surplus of Income over Expenditure for the year 1844 . . |  | £12,488 | 2  | 7  |

This, perhaps, contains facts of the most extraordinary kind ever yet brought before the public. Many, even among the Odd Fellows themselves, do not see the great moral and social revolution which the existence of such provident institutions is capable of effecting; but so long as a system of destructive and hurtful management prevails, no national or public blessing can flow from them. But reform the abuses—let the working man understand under what a delusive shadow he has placed his hopes—let him see the dangerous gulf into which all the funds of the Order are being carried, and then reflect what must be its fate twenty years hence, should such an awful exhibition of facts be continued—and there is no doubt he will soon perceive that his interests can only be promoted by a speedy removal of the fatal abuses.

The following is the state of the case in the 14 districts just referred to, which contains 297 lodges, and 17,059 members:—

|                                                            |              |
|------------------------------------------------------------|--------------|
| Ratio of Initiation Money to Contribution . . . . .        | 58 per cent. |
| ... Expenses of Management to ditto . . . . .              | 49 ...       |
| ... Management to Amount paid for Funerals . . . . .       | 138 ...      |
| ... Management to Amount paid for Sick Allowance . . . . . | 150 ...      |

Expenses of management actually 150 per cent. of that paid away to sick members! To relieve and give assistance to members during sickness ought to be, and is, the ostensible object of the institution; but here we have an example of that great virtue of charity and social refinement being sacrificed to the idle indulgence and intemperate appetites of a few

men who, when the cause of the sick and the distressed, the widow and the orphan is pleaded, are ready to rise in noisy turbulence to crush the well-intentioned endeavours of those who attempt to sweep away such intolerable abuses.

The recent opposition to the Board of Directors is most reprehensible, and no well-directed mind can look upon it otherwise than with the deepest regret. There never has existed any social and provident institution of anything like the importance of the Manchester Unity of Odd Fellows; neither, perhaps, did such gross abuses ever exist in any other. The real and essential objects of the Order have been overlooked, and rendered secondary to idle pomp and parade; and those funds which were meant to provide for disease and old age have been squandered on the follies and baubles of youth.

Now, however, that the Board of Directors have made a step in the right direction, let them be supported warmly and cordially. This done, a second and greater reformation must soon follow, which will place the Unity on a permanent foundation, and render it the most gigantic and useful institution of the day. Few, at the present time, understand the wonderful operation going on in the social state towards its own regeneration. Poor-laws and other nostrums seem as much to irritate as allay the disease; but here we have a self-supporting body which, although hitherto managed with a total disregard to science and practical experience, yet contain so much of benevolence, love, and social order, that no less than 40,000 yearly of the hard-working sons of toil embrace its genial comforts and solacing charms. What, then, must be its influence, if only guided by the light of reason, science, and experience, when confidence has inspired the nation in the judgment of its laws, and the integrity and practicability of its principles? There is little doubt that thousands for hundreds would join its ranks; and that the national protection against vice and its horrors, which political laws have failed to secure, would be wrought out by the social improvement among the working classes themselves. But to make such an institution permanent and secure, its means must be commensurate with the end in view; its monetary calculations must be correct, and in conformity with those laws of sickness and mortality which are known to influence its whole transactions.

The following is a still further analysis of the Income and Expenditure of the Order during 1844; and an inspection of the fourth column will shew that the average income from each member, in the shape of contribution, was £1 0s. 2½d., as stated in a preceding part of this Contribution, while the total income from each member, from all sources, as set forth in the sixth column, was £1 6s. 9¼d. It may be stated that those items are not calculated on the maximum number of members for that year, but on the mean number as given in Tables Y and A Y. Many useful applications may be made of this Table, but here it is only necessary to refer to a few of the items.

From a consideration of the following facts and figures it is abundantly evident, that so far as the whole Unity is concerned, the proposed scale, No. I, would not be safe; and the next question which arises is, the propriety of scale No. II, as prepared by the G. M.

TABLE A Z.

*Shewing the Proportion of Income and Expenditure in the Manchester Unity for each District, and to each Person, during 1844.*

| Districts.         | Ratio of Expenditure on Sickness to Contributions. | Ratio of Expenditure on Sickness and Funerals to Contributions. | Ratio of Total Expenditure to Total Income. | Income from each Member by Contributions. | Total Income from each Member. | Expenditure on Sickness to each Member. | Total Expenditure to each Member. |
|--------------------|----------------------------------------------------|-----------------------------------------------------------------|---------------------------------------------|-------------------------------------------|--------------------------------|-----------------------------------------|-----------------------------------|
|                    | Per cent.                                          | Per cent.                                                       | Per cent.                                   | £ s. d.                                   | £ s. d.                        | £ s. d.                                 | £ s. d.                           |
| Rural .            | 43·254                                             | 66·932                                                          | 71·870                                      | 0 18 9                                    | 1 4 3 $\frac{3}{4}$            | 0 8 1 $\frac{1}{4}$                     | 0 17 6                            |
| Town .             | 43·513                                             | 69·316                                                          | 74·578                                      | 0 19 5 $\frac{1}{4}$                      | 1 5 7 $\frac{1}{4}$            | 0 8 5 $\frac{3}{4}$                     | 0 19 1 $\frac{1}{4}$              |
| City .             | 44·089                                             | 70·466                                                          | 75·438                                      | 1 1 9 $\frac{1}{2}$                       | 1 9 3                          | 0 9 7 $\frac{1}{4}$                     | 1 2 0 $\frac{3}{4}$               |
| Whole }<br>Unity } | 43·702                                             | 69·224                                                          | 74·293                                      | 1 0 2 $\frac{1}{2}$                       | 1 6 9 $\frac{1}{4}$            | 0 8 10 $\frac{1}{4}$                    | 0 19 10 $\frac{3}{4}$             |

and Board of Directors, being adopted by the agricultural classes. The relation which scale No. II bears to scale No. I is that of 4*d.* to 5*d.*; or in other words, the same benefits for which the manufacturing classes are required to pay 5*d.* per week, the agricultural classes are required to pay only 4*d.* per week, or 20 per cent. less. Let us, therefore, examine whether there be sufficient reason for adopting two scales of contributions, and making the above distinction between the manufacturing or Town Districts, and the agricultural or Rural Districts.

On turning to Tables V and Y, it will be found that they represent the relative amount of sickness in the various districts according to the experience of friendly societies, and also according to the experience of the Unity itself; and as both classes of results agree so nearly, the monetary expressions deduced from the one may be held to represent the other.

The regulations of the Unity imply that allowances will be given in sickness, or during incapacity for labour, till the extreme of life, but the monetary Tables for the various districts provide for sickness to 70 years of age only. It will, however, be found that a deferred annuity, after that term of life, of half the amount, combined with the other, will be nearly equivalent to an allowance in sickness during the whole term of life. And the following illustration will shew their relative values. In Table A S, page 480, it will be found that, at the age of 30, the annual premium, for an allowance of £1 per week in sickness, during the whole period of life, is about £3 7*s.* 6*d.* Now, the annual premium for the same allowance up to age 70 is about £2 1*s.*, and the annual premium for a deferred annuity of 10*s.* per week after the age of 70 (Table A I, page 471), is £1 9*s.* 4*d.*; total annual premium for both, £3 10*s.* 4*d.* The difference between this sum and the preceding is, therefore, not so much as materially to affect the comparison.

Let us see, then, what annual payment would be required, in each district, for the following benefits, viz.:—10s. per week in sickness till the age of 70; £10 at the death of a member; a deferred annuity of 5s. per week at the age of 70; and £5 at the death of a member's wife,—which are equivalent to the benefits proposed in scale No. 1, or manufacturing class. The following shews the yearly payment which should be charged at the age of 30, for each of those benefits in the three districts, as well as in the three districts combined, which last group may be considered to represent the whole Unity:—

| Description of Benefit.            | Rural Districts*. | Town Districts*. | City Districts*. | The Three Districts combined. |
|------------------------------------|-------------------|------------------|------------------|-------------------------------|
|                                    | £ s. d.           | £ s. d.          | £ s. d.          | £ s. d.                       |
| 10s. per Week during Sickness . .  | 0 19 2            | 1 3 2            | 1 1 3            | 1 0 6                         |
| Deferred Annuity of 5s. per Week . | 0 16 7            | 0 11 0           | 0 10 10          | 0 14 8                        |
| £10 at the Death of a Member . .   | 0 3 5             | 0 3 11           | 0 4 4            | 0 3 8                         |
| £5 at Death of Member's Wife . .   | 0 1 3             | 0 1 7            | 0 1 6            | 0 1 4                         |
| The above four combined . .        | 2 0 5             | 1 19 8           | 1 17 11          | 2 0 2                         |

The figures in the above Abstract may be regarded as an approximation to the relative liabilities of the lodges in the various districts as near as our present knowledge will admit of arriving; and it is somewhat curious to observe, that those places or districts usually thought most hazardous are actually least so. There is no doubt that the members of the Glasgow A. M. C., in resolving to adopt two scales of contributions, were impressed with the belief that the lodges in the Town and City Districts were subject to greater liabilities than those in the Rural or Agricultural Districts, but the facts of the case will be seen to be otherwise. The error has, in all probability, arisen from supposing that the risks of the various districts would bear the same relation to each other as the rates of mortality among the members of those districts. In fact, the propriety of having two scales has been generally argued on that shewing; and under a cursory survey of the question, the one opinion was, perhaps, a natural enough sequence of the other; but a more comprehensive view of the subject will shew that the legitimate effect of increased mortality is to diminish the liabilities of the lodges, instead of increasing them as has been supposed.

It will be seen by an inspection of the figures in the preceding Abstract that the risk incurred from sickness, greatly exceeds that from the mortality of the members.

\* For the Rates applicable to the Rural, Town, and City Districts respectively, see pp. 471, 474, and 479.

Expressed in money, the relative values of those two items for each member entering a lodge at the age of 30, are—

|                                         |         |
|-----------------------------------------|---------|
| For 10s. per week in sickness . . . . . | £34 7 4 |
| For £10 at death . . . . .              | 3 14 10 |

the one being more than nine times that of the other. It has been equally well established, that increased mortality is not always accompanied with an increased rate of sickness; and the direct consequence of these two facts is to render the liabilities of lodges in what are usually called the healthy districts, actually greater in some cases than in the less favoured districts. For an illustration compare the Rural Districts in the preceding Abstract with the City District. The apparent anomaly may be explained in this way:—If 100 members, at the age of 30, were to enter a lodge in a Rural District, and at the same time 100 members of the like age were to enter another lodge in a City District, the result would be, that 40 years hence, when the surviving members had attained 70 years of age, in the Rural Districts 52 of the original 100 members would still be alive, while in the City District 38 only would reach that period of life. Well then, to carry out this illustration, suppose the plan of those lodges to have been to demand a single payment from the members on entering, to provide 10s. per week in sickness up till the age of 70, the 100 members on entering the lodge in the Rural District would have had to pay down £1986, but the members in the City District would have been required to pay £2041—exceeding the other district by only £55, and at the end of 40 years the funds of both lodges would be exhausted. Next, let us suppose that the foundation of those lodges was on the general plan of the lodges in the Order, in which a sick allowance is guaranteed till the extreme of life; then their relative liabilities will appear in a new light. The lodge in the Rural District has become saddled with 52 members, while in the City District there are only 38 members; and without further evidence it will be obvious that the lodge in the Rural District is placed under the greatest liabilities. During the succeeding ten years, each member in the Rural District would experience about 21 weeks' sickness yearly, and as there are 52 members, the aggregate sickness would be 1092 weeks yearly. On the other hand, each member in the City District would experience 24 weeks' sickness yearly; but as the number of members is only 38, the aggregate sickness would amount to 912 weeks per annum, falling short of the amount of sickness experienced by the lodge in the Rural District by no less than 180 weeks yearly. It will thus be seen, that the very fact of the increased longevity of the members of the Rural Districts, chiefly accounts for the increased liabilities of the lodges in those districts. The advanced period of life is that in which the great amount of sickness is experienced, and in the City Districts the members are cut off before attaining it; but the prolongation of life in the Rural Districts places on the sick list of a lodge a great mass of members at an advanced age, when they become also permanent burdens on the funds.

The relative liabilities, so far as sickness is concerned, in the two districts, may be represented by the following money expressions, which are the equivalents in a single payment, for members entering at the same age, to provide equal allowances in sickness during the whole period of life:—

|                           |     |    |   |
|---------------------------|-----|----|---|
| Rural Districts . . . . . | £36 | 19 | 5 |
| City Districts . . . . .  | 30  | 15 | 8 |

So far, then, it is obvious that the scales No. 1 and No. 2, published by the Board of Directors, are not at all applicable to the classes for which they were intended; for if the facts of the case were admitted to have any weight, they would go to reverse the application of those scales, and that which was meant for the Town or Manufacturing Districts and Classes, would be applied with more truth to the Agricultural Districts and Classes.

On referring to the preceding Abstract, it will be seen that the annual payments for the four benefits combined, amount, in the—

|                              |    |    |    |
|------------------------------|----|----|----|
| Rural Districts to . . . . . | £2 | 0  | 5  |
| Town Districts . . . . .     | 1  | 19 | 8  |
| City Districts . . . . .     | 1  | 17 | 11 |

So that if those benefits were adopted by the Unity generally, or any other scale of benefits bearing the same relation, the contributions in the Rural Districts, if adjusted on equitable principles, should be the highest, and those in the large City Districts the lowest, the smaller Town Districts being intermediate. It becomes, however, a practical question of important consideration, whether our knowledge of the subject has yet become so refined, and whether the difference in the risks of the various classes has been proved to be so remarkable, as to render two scales of contribution necessary.

If the results for the three districts combined, as given in the preceding Table, be viewed in connection with those for each of the districts, it will immediately appear that the difference, although of the opposite character to that anticipated, is, after all, exceedingly small, and, in a practical sense, unimportant; as there is scarcely another feature in the management of the various lodges, which has not more influence on their monetary affairs. For the City Districts, the difference is 2s. 3d. yearly; for the Town Districts, the difference is 6d. yearly; and for the Rural Districts, the difference is 3d. yearly.

To recognise, therefore, a difference in various districts, while lodges are, as in the Unity, all under the same general constitution, is clearly a refinement at which the most improved institutions of the day have not yet arrived.

An inspection of the same Abstract will further prove, that if the regulations of the lodges in the Unity were such as to give a member the option of providing any one or more of the four benefits, the case would be immediately altered, and it would become, in that event, necessary to make a distinction in the payments. There is no doubt that even

this change, with many others of an important nature, will take place before many years pass away, and render the Order the great asylum of the working and industrious classes, to which they can, with confidence, resort for relief from the pecuniary distress and indigence which almost invariably attend sickness and disease.

It will not now be necessary to enter into the question of the influence of employment or occupation on the liabilities arising from the various classes of members, as it is evident that the increased mortality and sickness in peculiar trades place them relatively to the Unity in a similar position with that which the members of the City Districts were shewn to hold to those of the Rural Districts; and, therefore, the same arguments used in respect to the influence of locality on the liabilities of lodges, are equally applicable to the question of employment.

The preceding results, drawn from direct observation and calculation, shew that there is, in fact, no reason to make any distinction between the manufacturing and agricultural classes in the Unity; and hence, since it has been shewn that scale No. 1 is unsafe, and must bring ruin on the institution, the danger to be apprehended under scale No. 2 is still greater. There remains, however, another way by which to shew to members the remarkable uniformity which prevails among those results for various classes of the community, and the precision with which their various liabilities may be determined under a proper analysis of the subject; and for this purpose reference is made to Table A Z.

An inspection of the first column of that Table will shew, that in the various districts the expenditure on sickness bears a very striking and uniform relation to the amount of contributions; and, therefore, some very powerful influence must prevail, or so positive a determination of the results could not be produced. In the whole Unity, the expenditure on sickness is 43·702 per cent. of the income from contributions, and in none of the districts is the difference in this item so great as one-half per cent., or 1-87th of the whole. So uniform a result is well calculated to inspire confidence in those laws of sickness which represent the liabilities of benefit societies of every description. Again, in all the other columns of the same Table, a similar harmony will be found to prevail; but, as items of a fluctuating character enter into those columns, the results are somewhat disturbed, although not to any important degree. It will be seen that the relation of column 7th to 5th is expressed by the figures in column 2nd. It will likewise be seen, that the income from each member is least of all in the Rural Districts, somewhat higher in the Town Districts, and greatest of all in the City Districts; but then it will be further seen that the expenditure on sickness in each of these districts bears almost precisely the same relation to the respective incomes of those districts. An inspection of column 4th will, however, shew that in the Rural Districts, although the expenditure on sickness is in the same proportion as the other districts, still the ratio of the total expenditure to the total income is less than in the other districts; this, no doubt, arises from a difference in the mode of management, and admits of ready explanation.

The following will shew the total surplus or saving to each member of the Unity, for each of the Districts, during the year 1844:—

|                                                                 | Rural District.                | Town District.   | City District.                 | The Three Districts combined.   |
|-----------------------------------------------------------------|--------------------------------|------------------|--------------------------------|---------------------------------|
| Actual Saving to each Member . . . . .                          | £ s. d.<br>0 6 9 $\frac{3}{4}$ | £ s. d.<br>0 6 6 | £ s. d.<br>0 7 2 $\frac{1}{4}$ | £ s. d.<br>0 6 10 $\frac{1}{2}$ |
| Saving per Cent. on the Income for }<br>each Member . . . . . } | 27 per cent.                   | 26 per cent.     | 25 per cent.                   | 26 per cent.                    |

It will thus be seen that there does exist some general principle or law by which the relation of expenditure to income is regulated in the Order. A remarkable uniformity was shewn to prevail in the ratio of expenditure on sickness to the income from contributions ; the result in none of the districts differing by one-half per cent. from that for the whole Unity, so also will the relation of the total expenditure to the total income in the various districts be found to differ but little.

It is, therefore, obvious that, so far as the experience of the Unity goes, there is no reason to believe that the lodges in the Rural Districts are in a more favourable condition than those in the larger Towns and Manufacturing Districts. It is equally clear, from the facts and principles adduced elsewhere, that on the scheme on which the lodges of the Order are conducted, there is no reason for having two scales of contributions ; and that, before such innovations are introduced, other important changes, of a character not yet recognised in the Order, must take precedence. It consequently follows that all the objections brought against the adoption of Scale No. 1, come with redoubled force against the introduction of scale No. 2. The recent appeal made by the Board in favour of the general adoption of scale No. 1 is, therefore, to be strongly approved of ; and it is hoped that a strenuous effort will be made to induce the lodges to relinquish both scales, and determine on one better calculated to carry out successfully the high and beneficial purposes of the Order. The means of obtaining competent opinions on such subjects are ample ; and it should be the imperative duty of every member, but particularly of every officer of a lodge, and in an especial degree of every one of the directors, to institute a searching inquiry, and settle a question, the importance of which cannot be doubted, and the angry and unprofitable discussion of which now threatens so much danger to the Order.

One remarkable feature connected with the history of Odd Fellowship, is that of exacting a uniform rate of contribution from all members from 18 to 40 years of age. Almost every other friendly society of any pretensions has long relinquished any such plan. When the laws of sickness and mortality were but imperfectly understood, it was natural enough to expect no distinction to be made for difference of age ; but those days have

passed away, and no scientific fact is now better established than the influence of age on the amount of sickness and mortality. It is, therefore, surprising that an institution of the gigantic proportions of the Manchester Unity, should have remained to the present time, either quite ignorant of such a principle, or indifferent to its importance.

By consulting Tables V and X, the influence of age on the amount of sickness will become evident. In the decennial period of life from 20–30, the amount of sickness to each member is under 9 weeks, but in the period from 60–70 years of age the sickness equals above 77 weeks, and in the intermediate periods of life, like differences prevail. The injustice of admitting members at those extreme ages on equal terms is therefore obvious, but even within the ages recognised for admission by the Order striking differences will appear.

The results in the following Abstract are derived from the respective Tables in this Contribution.

| Yearly Payments required.                                                  | Age 20. | Age 30. | Age 40. |
|----------------------------------------------------------------------------|---------|---------|---------|
|                                                                            | £ s. d. | £ s. d. | £ s. d. |
| To secure 10s. per week in Sickness for whole life (see Table A R) . . . } | 1 3 6   | 1 12 0  | 2 6 9   |
| To provide £10 on the Death of a Member (see Table A M) . . . }            | 0 2 9   | 0 3 6   | 0 4 9   |
| For £5 at Death of Member's Wife (see explanation, page 498) . . . }       | 0 1 0   | 0 1 3   | 0 1 8   |
| Total payment for the above Three Benefits                                 | 1 7 3   | 1 16 9  | 2 13 2  |

From the above Abstract it will be seen that the payments necessary to provide for the above benefits at age 40, are nearly double those required at age 20; nothing could therefore be more absurd than to admit members entering at those ages on the same terms: and yet this is, in effect, done by the Order. It is true, that according to the 32nd General Law, members entering at ages under 35 pay entrance or initiation money of £1 1s., but those entering at age 43 pay £5 5s. Let us, therefore, determine to what extent those sums will affect the yearly contributions. On going back to Table A H it will be found that those entrance moneys are, at age 20, equivalent to an annual payment of—

|                     |             |
|---------------------|-------------|
|                     | £0 0s. 11d. |
| at age 30 . . . . . | 0 1 0       |
| at age 40 . . . . . | 0 6 0       |

Hence it will follow that the yearly payments by those entering at the given ages should be augmented by the above sums, which are equivalent to the initiation fees paid to them; and the following will shew the yearly sums thus actually paid by the various classes of members according to the proposed scale, and the sums which ought to be paid.

| Age at Entry.                  | Actually Paid. | Ought to be Paid. | Deficit. |
|--------------------------------|----------------|-------------------|----------|
|                                | £ s. d.        | £ s. d.           | £ s. d.  |
| Members entering at Age 20 . . | 1 2 7          | 1 7 3             | 0 4 8    |
| Ditto ditto 30 . .             | 1 2 8          | 1 16 9            | 0 14 1   |
| Ditto ditto 40 . .             | 1 7 8          | 2 13 2            | 1 5 6    |

The danger as well as the injustice of following such a practice must be obvious to the most casual observer. By young members joining the Order at age 20, there is an annual loss of 4s. 8d.; but by those entering at age 30, the yearly loss is increased to 14s. 1d.; and by those members entering about age 40, the loss per annum is as much as £1 5s. 6d.; so that in fact this last class of members pay little more than half the yearly sum necessary to meet the liabilities incurred by the lodges through their membership. The injustice thus done to those who enter at an early period of life, and the perilous position in which the whole Order must be placed by the admission of members of 30 years of age and upwards on the same terms, should call for immediate reform. The abuses of Odd Fellowship are of the most serious and alarming nature; and if not at once struck at the root and eradicated, they will soon become too formidable to admit of the possibility of applying any remedy.

Many attempts have lately been made to meet such arguments and facts as the preceding, by bringing forward the experience of particular lodges; but a very few observations will readily shew the impropriety of such a course. The experience of the Providence Lodge, Manchester, for the period of 13 years, has just been published, from which it appears that the sickness of each member varies in some years from 6 hours per annum to 10 days 2 hours, and the average for the whole period is 4 days and 6 hours to each member; but when it is stated that those fluctuating results are deduced from a society in which the number of members varied in the same period from 24 to 82, no surprise will be felt at such irregular results. To argue any principle or rule for the guidance of lodges in general, from so limited and meagre a body of evidence, would be as futile as to measure the value of life in the whole community from the results of mortality in an individual family. Many other instances can be furnished, illustrative of the wide discrepancies resulting from small numbers. For example, taking 8 different lodges, of ready reference from the October Quarterly Report of the Manchester Unity, in which there are in all 265 members, it is found that the average sickness to each, during the year 1844, was only 2 days and 13 hours; but taking 8 other lodges with 294 members, the average sickness was no less than 10 days and 18 hours. Such results are not at all extraordinary or unexpected. To the most limited observer it is well known that it is only an essential feature of the law of sickness. With small numbers no guarantee can be given for particular results; but as the number of persons over which the observations extend are increased, then a nearer approximation to the defined law will manifest itself. On

referring to a report of an interesting nature, although defective in some of its details, recently issued by the Blackburn Districts, it will be found that during the five years, 1841-1845, the number of members varied from 1510 to 2154; or more correctly, the average number of members exposed to the risk of sickness during that time was 1654, and the total amount of sickness was 7109 weeks, or 6 days and 3 hours to each member yearly. If disparity of age, and some other features connected with this report, were taken into account, a near approximation would be found to the rate of sickness as developed in the early part of this paper; but if the numbers observed were extended still further, and formed into large groups, such as those given in Table Y, then the results would produce a complete verification of the law of sickness.

These observations naturally lead to the recognition of another grand feature in the principles of these institutions, which might be well and effectively carried out within the Manchester Unity. Owing to the very small number of members in each lodge, it is impossible, even under the best and most skilfully graduated Tables, that the lodges could be safely and firmly established if existing independent of each other. The following analysis has been made of the number of members in the various lodges during 1844, according to the classification described at pages 19 and 421 *ante*.

| District.       | Lodges. | Average Number of Members. | Number of Members in each Lodge. |
|-----------------|---------|----------------------------|----------------------------------|
| Rural . . . . . | 1138    | 66,208                     | 58                               |
| Town . . . . .  | 1240    | 77,070                     | 62                               |
| City . . . . .  | 1304    | 99,747                     | 77                               |
| Whole Unity .   | 3682    | 243,126                    | 66                               |

It requires but little practical knowledge to understand that many such lodges, as above, would be destroyed from the operation of other causes than inadequate contributions. The average number of members appears to be about 66 to each lodge; and it is apparent that, if three or four unhealthy members were to gain admission to any one of these, it must soon break down, even with highly graduated terms; but where lodges number ten or a hundred times as many members, there is but little danger to be feared from such accidents. One of the most valuable features to be introduced into the Order would therefore be the formation, either of all the lodges into one grand parent society, or of a certain number into districts, with united interests. The practical details for carrying out such a plan are perfectly simple; and the advantages to arise so obvious, that it deserves the best consideration of members.

The reports of the Blackburn and Preston districts of the Manchester Unity sufficiently prove the great hazard and risk attending small lodges or societies, and how uncertain must be their stability, from the marked fluctuations to which small numbers

are always subject. In January 1848, the Blackburn district consisted of 28 lodges, and 2109 members, or about 75 to each lodge; and in the preceding year they experienced 15,507 days' sickness, being about 7 days 8 hours to each. However, in one lodge, consisting of 57 members, the sickness in that year did not average more than 17 hours to each; but in another, having 47 members, the sickness averaged upwards of 35 days to each member, or about 50 times more than the other lodge; and 6 only of the 28 lodges experienced anything like a near approximation to the average result.

Again: in another report made by the Blackburn District, in which the sickness and mortality for the five years 1841-5 is furnished, it appears that even the average for the whole five years, in the various lodges, differs widely, being as high as 10 days 16 hours in one, and only 2 days 6 hours in another, while the average for the whole five years, for all the lodges collectively, was 5 days 20 hours. It is hence obvious that, even over a series of years, considerable fluctuations take place in the rate of sickness among individual lodges.

In the report of the Preston District Sick Union of the 19th of April, 1850, this subject is treated with much judgment, and a Table is furnished of the experience of the lodges in that district for two years, of which the following is an Abstract:—

*The Average Amount of Sickness amongst the Members of the Preston Sick Union,  
Independent Order of Odd Fellows, M.U.*

| 1848-9.                      |                    |                             | 1849-50.           |                             |                             | Average for 2 years. |  |
|------------------------------|--------------------|-----------------------------|--------------------|-----------------------------|-----------------------------|----------------------|--|
| NAME OF LODGES.              | Number of Members. | Average amount of Sickness. | Number of Members. | Average amount of Sickness. | Average amount of Sickness. |                      |  |
|                              |                    | days. tenths.               |                    | days. tenths.               |                             | days. tenths.        |  |

| 14 Philanthropic . . . . .   | 85                 | 4 7                         |                    | No Return.                  |                             |                      |  |
| 15 Morning Star . . . . .    | 55                 | 6 2                         | 57                 | 4 6                         |                             | 5 4                  |  |
| 16 No Danger . . . . .       | 70                 | 10 7                        | 60                 | 8 5                         |                             | 9 6                  |  |
| 17 Glorious Apollo . . . .   | 49                 | 2 4                         |                    | No Return.                  |                             |                      |  |
| 18 Prince Albert . . . . .   | 24                 | 2 4                         | 61                 | 1 7                         |                             | 2 0                  |  |
| 19 Farmer's Glory . . . .    | 40                 | 8 3                         | 45                 | 3 7                         |                             | 6 0                  |  |

Over the period of two years, to which the above observations extend, the average sickness was 7·3 days, while in one lodge the ratio was 2 days to each member, and in another as much as 14 days. It is possible that some of the differences in the above Abstract may be due partly to other causes than the fluctuation of small numbers, since six of the above lodges had in the year 1848-9 less than 50 members, and in the following year there were four lodges with less than that number. The experience, therefore, of the most careless observer, must have shewn him the insecurity of every society with so small numbers; and it is to be hoped that the example of the Preston Sick Union will be speedily followed by other districts of the Unity.

The report already alluded to by the Board of Management is so important, that no apology is needed for giving it at length.

*Report of the Board of Management of the Preston District Sick Union, Independent Order of Odd Fellows, M.U., presented to the Delegates assembled from each lodge in the Union, at the adjourned Special Meeting held at the house of Host Gerrard, the King's Arms Inn, on Wednesday Evening, the 10th of April, 1850.*

“The Board of Management, in presenting a Report of the operations of the Union during the two years of its existence, deems it expedient to enter a little into detail upon the causes which led to its formation, and the principles upon which it is based.

“The extensive organisation, the rapid growth, and the unquestionable importance which the numerous secret and benefit societies of this country had assumed a few years ago, very naturally attracted the attention of members of other classes in society, than those more immediately connected with them. The soundness of the financial position of many, and particularly of the Independent Order of Odd Fellows (the most extensive and important of these institutions), had been the subject of much discussion; and many various and conflicting opinions on the subject were advanced. The great utility of societies of this character, and the vast amount of advantages they were calculated to confer upon society in general, and the industrious classes especially, provided their financial regulations were based upon sound scientific deductions from correct data, was however pretty generally acknowledged. Mr. Neison, the eminent actuary, in his “Contributions to Vital Statistics,” published in 1845, acknowledges this, although he exposes many of the errors into which they had fallen, owing to the want of adequate scientific information. He says, (page 90,) ‘An immense number of societies were formed in a very short period, and their contributions regulated by the most delusive and inadequate data; so at the present time very few are to be found calculated to survive many years. Under a scientific and amply developed system, those societies would be calculated, at no distant period, to completely remove the cause of nearly all that poverty, distress, and misery which haunt our manufacturing towns, and fill our workhouses with the working classes of the country; but, owing to the imperfect and unstable foundation on which they are at present built, instead of being a help and support to a poor man, they involve him in those difficulties for which he might otherwise have provided. On becoming a member of such a society, he reasonably looks forward to it as a support for his declining years, and a protection during periods of sickness and disease; but ultimately, at the very time when assistance is required, he discovers that the society has been formed upon a *ruinous plan*, that the increasing years and infirmities of its members have absorbed all its funds, and that those surviving must be thrown

destitute on the parish as a public charity.' That these observations are unfortunately but too true, is proved by the statistical Tables tendered by Mr. Barlow, of Birmingham, in his evidence before the Select Committee of the House of Commons, on the Friendly Societies' Bill, last year; which Tables were formed from actual evidence taken from the experience of the workhouses of Birmingham, Alresford, and Winchester Unions. Mr. Neison afterwards says, at page 138 of the same work, 'It is evident that the Order of Odd Fellows stands in need of much improvement; and considering that 33 Members of Parliament, and between six and seven hundred of the clergy, as well as many other elevated names, are said to be enrolled as members, it is remarkable that some gentleman of influence and scientific attainments should not before this have given attention to the lamentable condition in which his too confiding brethren of the Order are placed, and have done something to raise the Unity to the common level, at least, of the friendly societies throughout the kingdom.' This is certainly very sweeping language; yet if, on the one hand, it be granted, owing to the insufficiency and incorrectness of the materials upon which Mr. Neison, at that time founded his calculations, that the portraits he draws of Odd Fellowship, its position and prospects, presents a rather more unfavourable likeness than the reality warrants, yet, on the other, it must be confessed that there existed but too many causes to justify the sombre hue which he threw over it. That our financial system was of a purely fortuitous character; that our rate of contribution was inadequate to the realisation of the benefits promised, was flagrantly apparent to those who were in possession of any knowledge on the subject. It was and still is a question of the highest importance to the interests of the members themselves, that their true position should be correctly ascertained, and clearly and honestly exhibited before them. The active exertions of some of the friends of the Order caused considerable improvement to be effected at the Glasgow Annual Moveable Committee. The spirit of inquiry, once awakened, rapidly advanced in the right direction; and the demand for correct information on the subject has resulted in the compilation of Tables founded upon the Order itself. After these Tables shall have been presented to the Unity at large, doubtless many further important improvements will be cheerfully introduced.

"Following side by side with these steps of progressive improvement, the Preston District Sick Union was established for the purpose of remedying another defect in our constitution, which was calculated to be productive of as much disastrous consequence as the insufficiency of the contribution itself. The defect alluded to is the now admitted statistical fact, that there can be no certainty of permanency in independent societies of small numbers, a large extent of basis being absolutely necessary to approximate to anything like a certain average of liability. Mr. Neison, in his evidence before the Select Committee of the House of Commons, last year, is very explicit on this point. He says, 'Societies must have numbers sufficiently large, also, to warrant any process of calculation being applied to their guidance. If the society were very limited in its numbers, the wisest calculations would be of little use, because they would be disturbed by great fluctuations. It is quite possible that a society of 50 or even 100 members, using Tables that are perfectly safe to the average of all friendly societies, might not provide half the contributions that are necessary for its own peculiar circumstances, or it might provide double the amount which is necessary.' Again he says that, 'a society consisting of 1000 members might be perfectly safe upon a Table calculated upon known data:' but he afterwards says, 'that 100 would not be safe under any calculation. The result would be matter of accident; there would be fluctuations, and these might be towards the maximum or minimum.' Again he says, after alluding to the subject in detail at some length, the 'effect in the long run would be to amalgamate the smaller societies, making them into societies of greater numbers, in order to attain an average.' Mr. Neison grants that 'a society of 300 members might approach to safety;' yet it is evident that he prefers a much wider basis than even that. Indeed the principle is, the wider the basis the greater the

certainty of an average; the only limit being that it shall not become so extensive as to interfere with its judicious and efficient management.

“Many other parties amongst the ablest and most intelligent of the advocates of our Order, and its great and benevolent objects, have recommended, and are still continually recommending to us, the adoption of this principle, in some form or other. In a very elaborate and very favourable article on the subject of friendly societies, and particularly Odd Fellowship, published in the supplement to the ‘Leeds Mercury,’ of the 22nd Jan., 1848, after defending the Order from several groundless charges which had been preferred against it, the causes are analysed which operate to produce the rapid accumulation of funds in some instances, and the absolute insolvency of lodges in others. The writer afterwards proceeds to say: ‘The remedy we would here respectfully suggest is simple and obvious, namely, the extensive union of the lodges of a district for the purpose of relieving the sick members out of one general fund—a practice already adopted by districts in the dispensation of funeral gifts, and which has been found to work very satisfactorily. By this simple expedient, the accidental burden which at present frequently involves single lodges in serious difficulties, would, by being spread over a large surface by means of a more extensive union of interests, be in a great measure averted; they would then cease to have a partial operation, and becoming amenable to the general law of life assurance, would be provided for without any difficulty out of the general funds of the society.’ Mr. Sanders, of Birmingham, too, in his evidence before the Committee of the House of Commons, in reply to the question, ‘What number (of members in a society) would you recommend?’ said, ‘I think the larger the better. I do not think your number can be too large,—a thousand or 10,000. We have 5000 in ours now.’ In a very able article, written in the kindest and most favourable spirit, and published in ‘Eliza Cook’s Journal,’ of the 16th of last month, after eulogising our objects, and giving us ample and full credit for the good that has resulted, and is still likely to result from such institutions, the writer, amongst other suggestions for our improvement, says: ‘The security and reliability of benefit societies would also be increased by a combination of their now separate and distinct lodge funds into a united fund. At present, lodges with a preponderance of old members are avoided by the young, and the consequence very often is, that the old lodge, from the heavy sickness of its more aged members, becomes unable to meet the claims upon it, and the box is closed or it breaks up. Were the members of the various societies combined together in one grand union, and the rates made sufficient, any such calamity as this could not occur.’ Although much of the evidence here produced has been published since the establishment of the ‘Preston District Sick Union,’ it was a conviction of the truth of the great principle therein enunciated, which led to its formation. Of course, like most other innovations upon ancient usages, the Union has met with some opposition, but by no means so much as might reasonably have been anticipated. The eminent actuary before quoted, says, ‘There is a very great difficulty is persuading societies to immediately reform; and I think it is not to be wondered at that it should be so, because it is a difficult question really to comprehend; nothing but the lapse of time, the force of public opinion, and the question being frequently agitated, will ultimately bring about that amount of reform in their condition which is necessary.’ The Board has every reason to congratulate the members of the various lodges on the progress which this most important question has already made in the public opinion.

“By the Table which accompanies this Report it will be clearly seen that our own practical experience for two years fully bears out the theory of the projectors and advocates of the union. The great uncertainty of liability in lodges of small number is exhibited so fully, that the most sceptical must immediately recognise the fact. Take the lodges numbered 12, 17, and 18, and then those numbered 9 and 11, the whole of which possess less than 50 members each. The minimum liability for the first year, is 4s. per member, and the maximum 20s. 1½d., above 500 per cent. of a variation!

Again, compare the first year of No. 12 with the second, and the result is a variation from 5s. 6d. each to 23s. 8½d., proving that the very lodge itself which appears so very healthy during one period, may be in a very short time placed in the very reverse position! The second year presents a variation of a still more alarming character, the lowest liability being 2s. 10d. each and the highest 25s. 6½d.! By referring to lodges Nos. 1, 3, and 6, the largest on the list, and numbering between 100 and 200 members each the great principle of the Union begins to develop itself, that the broader the basis, the more certain is the average; the highest rate per year being 13s. 5½d., and the lowest 5s. 9¼d. If we follow the operation of the broader basis to the whole extent of the Union, we arrive at the gratifying fact, that the variation almost entirely disappears, the difference in the average liability between each year being no more than eight pence! The average amount of liability of the whole district, too, and this is a highly important fact, approximates very nearly to the average of friendly societies in England and Wales. The Board is not yet in possession of sufficiently correct data respecting the ages of the whole of the members, to state the precise variation in this respect; but after another year's experience there is good reason to believe the difficulty will be removed.

"The Board alludes with regret to the circumstance, that two of the lodges which originally joined the compact thought proper to secede from it. It would perhaps be impossible to state with certainty what precise causes led to this result, but it is more than probable that to the difficulty to which Mr. Neison alludes it ought mainly to be attributed. Certain it is that it was not (in the opinion of the Board) through the discovery of sufficient reasons to confute the arguments in favour of the great principle on which the Union is based, nor from any unkind feeling between the members of the seceding lodges and those composing the rest of the Union.

"It is somewhat singular that there should have been much difficulty in rendering this principle clear to the perception of our brother Odd Fellows, particularly when it is taken into consideration that it has been recognised for some time by them with respect to the liabilities attending the mortality of the members. The Board feels confident that the facts here presented will have some weight with the more reflecting and intelligent of our brethren, and will stimulate them to further exertion in the holy cause of rendering our valuable and much cherished institution more permanent, and of more fully and efficiently practically developing the great principles upon which it is based. The Independent Odd Fellows will surely not lag behind the times in this age of discovery and progress, but will rather press forward in the van of the great intellectual army which is now so rapidly achieving the most glorious of conquests, the subjugation and ultimate extirpation of the great enemy of social, moral and physical progression, 'popular ignorance.' They will not, it is confidently asserted, imitate the example of the foolish bird in the desert, which, on the approach of danger, thrusts its head into the nearest bush, fondly believing that by blinding itself to the fact, the evil will cease to exist; but that they will rather, from the inmost chambers of their hearts, cheerfully echo back the dying words of the illustrious Goëthe, 'Let in more light;' that they will struggle more manfully and earnestly to prove that they are not undeserving of the high compliment lately paid to them\*, that they are among the most *élite* of the working classes of this country both morally and intellectually.

"Signed on behalf of the Board,

C. HARDWICK, PROV. G.M., CHAIRMAN.  
ROBT. RABY, PROV. G.M., VICE-CHAIRMAN,  
THOMAS BINGHAM, HON. SECRETARY."

\* See "Eliza Cook's Journal" of the 16th March last (1850).

There is likewise a most remarkable example of the danger attendant on the management of small societies, to be drawn from the Quarterly Report for October 1845, of the Manchester Unity. The following is a brief Abstract which I have made of some of the more striking and anomalous results, an attentive consideration of which must shew how very much subject to fluctuation is the mortality, when viewed in connection with small numbers.

It is to be borne in mind that the preceding figures relate to whole districts, embracing each on an average 22 lodges; and if the fluctuation be so very remarkable in relation to the combined results of whole districts, how great must be the danger in which individual lodges, having to meet their own liabilities, are placed! There is, perhaps, no improvement of which the Manchester Unity stands in more need, than the distribution, in whole or in part, of the fluctuations to which lodges are subject over districts sufficiently large to guarantee average results.

One point of importance in the management of lodges, is the proper investment of their funds. The preceding calculations and premiums would be inadequate to carry out the purposes intended, unless 3 per cent. compound interest, at least, be realised on the surplus funds, without any deductions for expenses of management. A single illustration will be sufficient to illustrate the great accumulations expected to arise from such mode of investment. Take the case of a young man entering a lodge at age 30:—he will have an equal chance of living 39 years; or in other words, of 100 members entered at that age, one half of them would live to attain 69 years of age, and during that period each would experience 115 weeks of sickness. Presuming that the funds were not invested at interest, each would be required to pay down £115 to enable the society to pay £1 per week during sickness; but on referring to Table AS it will be found that £68 14s. 6d. is all that is required to enable the society to meet its liabilities, provided the funds are improved at 3 per cent. compound interest. Again: if the question of mortality be considered, proof of the same advantages will be found. It is evident that, if money made no interest, according to Table AL, each member, on entering, would need to pay down £100 in order to provide £100 at death; but because, in calculating the same table, monies are assumed to improve at 3 per cent. compound interest, £37 8s. 4d. only is required.

In connection with the preceding remarks relative to sickness, it may be stated that in a recent number of one of the periodicals connected with the Order, a letter appeared setting forth a statement, that about 32 weeks was the amount of sickness required to terminate life in country as well as town; and from this starting-point a number of strange deductions and most fallacious conclusions were drawn, with a view of shewing that the proposed scale, No. 2, would be adequate, with good management, for a town lodge. It is surprising that this statement should have passed muster, and that the fallacy escaped the detection of the talented editor. It was only necessary to refer to the last October Report, issued by the Board of Directors, for a refutation of so dangerous a fallacy. It will be there found, as given in Table Y of this Contribution, that during 1844 there were 2286 deaths of members, and 226,917 weeks' sickness. From these two results it is therefore obvious, that during that year there was no less than 99 weeks' sickness to each death, or more than three times that stated by the writer in question. If the foundation of his argument be so much at fault, it is equally evident that his

recommendation relative to the adoption of scale No. 2 merits little confidence. The fact that there are more than 32 weeks' sickness to each death, can be proved by the results given at page 450 of this Contribution, in which that particular question has been investigated for the mortality and sickness at each term of life. At age 30 it will be found that there is about 116 weeks' sickness to each death. This differs from the results in the whole Unity, but the difference admits of a simple explanation, for on referring to pp. 421 and 493 of this volume, it will be found that the value of life in the Order is not quite so great as in the other friendly societies, and hence the somewhat shorter duration of life in the Order exposes the members to a less amount of sickness. The method, however, of taking a general average of sickness to the deaths, without regard to age, will be found subject to another error; for it will be seen that while at the period of life 31-35 there are 116 weeks' sickness to each death, at the term of 60-70 there are no less than 252 weeks to every death. An extension of this argument may be found useful in the management of the Order, for as the ages of the members increase, so also will the ratio of sickness increase in a higher ratio than the deaths; and although at the present time there are nearly 100 weeks of sickness for one death, in a few years, when the ages increase, it may happen that there will be 150 weeks' sickness for every death. On referring to the results given in Tables E and L, pp. 27 and 77, it will be found that, taking the population of friendly societies in England and Wales, as actually distributed, there are 157 weeks' sickness to each death, and in Scotland 145 weeks. These results differ slightly from each other, because there is a variation in the distribution of the two populations over the various periods of life. In the former, the greater number of old members has a tendency to increase the average amount of sickness. An extension of those arguments and figures has shewn in Table A G that of the male population of England and Wales above 10 years of age, 261182, or 4.5257 per cent., are constantly sick.

It has been often said, that the deficiencies in the rates of contribution will be amply compensated by the donations to the society, and the number of members who never seek relief from it. The latter part of the argument clearly falls to the ground, as the actual amount of relief given is quite equal to that anticipated by the Tables; and as to the benefits to be derived from donations, which some have represented erroneously at 20 per cent. of the whole income, it will be found that the amount from all sundry items not only does not help the contributions of the Order, but is inadequate to meet the expenses of management, being only 42 per cent. of that amount. It is, therefore, imperative on the Order, so far as donations are concerned, to graduate their rates on a scale equivalent at least to that given in the Tables already referred to.

Another argument frequently brought forward in favour of low rates, is the relief which the funds of lodges will experience by allowing only a reduced rate of aliment in long continued sickness. This argument can only be viewed as a desperate expedient to prop up a falling institution, and not calculated to afford any adequate support. The

first question which would naturally arise in an intelligent mind, is the practicability of applying such a principle to life contingencies, and the possibility of calculating the average duration of each attack of sickness at various ages. Unless the solution of this last question be first accomplished, it is evidently nothing short of quackery to proceed by random in the management of a society or lodge, under the blind belief that a reduction of aliment in long continued sickness will produce the great benefits to the funds which has been so often argued. No writer on Vital Statistics has yet solved the problem, and therefore means are not at present available to aid or warrant any one in stating the particular amount of relief which would be afforded by the introduction of such regulations. From the data and facts, however, given in Tables N N, O O, P P, and Q Q, enough is known of the subject to satisfy any diligent inquirer, that practically the funds of a lodge would be but little influenced by any such circumstances, except at very advanced periods of life, at which it will be presently shewn that a much better remedy or cure is available on scientific and understood principles, and that there is no need therefore of having recourse to expedients of a doubtful nature. It may, however, be here mentioned, that although much information has been given in the preceding on the question of the duration of each attack of sickness, still in anything like a complete form it is now for the first time, under investigation, with a view to publication, but in the meantime, and at this stage of the question, inspection of the second and fourth columns of the Table R R, page 450 of this Contribution will satisfy any one of the little practical advantage to result to a lodge or society by the adoption of such a regulation, while it must occasionally be attended with most serious injury to individual members. As formerly remarked, the great and essential and noblest feature in friendly societies of every description, is the certainty that under a skilfully developed system they will afford to members a competent support and complete independence, during sickness and disease. Admitting this integral element to have its full weight, and keeping in view the fact that in the Order itself the average full allowance in sickness is a little under 10s. per week, it becomes a serious question, whether the great principle of such an institution is not violated by admitting the existence of a regulation, which in the prime of life may reduce the support of an industrious workman, with possibly a large family, to the miserable pittance of 5s. weekly. It is evident that this would constitute pauperism itself. To these observations it may be replied, that the very fact of the principle affording but little relief to the funds, goes to shew that but few of the evils here detailed would occur. This, no doubt, is perfectly true; still individual cases must occasionally arise, and no society or lodge can be justified in admitting a principle which can possibly subject any one of its members to so hard a fate.

It is obvious that, if it be necessary to reduce allowances in long-continued sickness, such reduction will most effectively aid the funds in the advanced term of life; and fol-

lowing out this idea, it will be found that another principle is available, which is free from the objections of the preceding scheme, and at the same time fraught with most important monetary advantages to the members individually and collectively.

In an advanced period of life, say after age 70, it will always be a more difficult matter to define sickness than during an earlier period; and in the management of all benefit institutions which have existed long enough, this has been found a most serious practical difficulty, and so much felt, that up to the appearance of the present calculations no sickness Tables went beyond that term of life. Carrying out this view, it will be found, that by relinquishing sick allowances after 70 years of age, or any other term of life that may be fixed on, the practical management of lodges will become much simplified, their constitution strengthened and rendered more secure, and the moral character of the members exposed to less temptation.

The first part of the question to which we shall direct attention is that by which it will be seen that, under the plan of discontinuing the sick allowance at age 70, and substituting a deferred annuity at that age of one-half the amount of the weekly sickness allowance, the contributions from members would be very nearly the same as those which would be required to provide for a sick allowance to the extreme of life. In this instance we shall take the case of a member entering a lodge at age 32, the average age of the members in the Unity; and we shall further suppose that all his contributions will close after attaining age 70, and determine the yearly payment required under both conditions.

In the first place, to provide for the various benefits, including a sickness allowance to continue during the *whole period* of life:—

|                                         |   |   |   |   |   |   |    |    |    |
|-----------------------------------------|---|---|---|---|---|---|----|----|----|
| Payment for 10s. weekly sick allowance* | . | . | . | . | . | = | £1 | 16 | 6  |
| £10 at the death of a member            | . | . | . | . | . | = | 0  | 3  | 11 |
| £5 at the death of a member's wife      | . | . | . | . | . | = | 0  | 1  | 5  |
| Total yearly payment                    | . | . | . | . | . | = | £2 | 1  | 10 |

In the next place, to provide for the same benefits, but including a sickness allowance up to age 70 only, and after that period a deferred annuity:—

|                                        |   |   |   |   |   |   |    |    |    |
|----------------------------------------|---|---|---|---|---|---|----|----|----|
| Payment for 10s. weekly sick allowance | . | . | . | . | . | = | £1 | 1  | 9  |
| £10 at the death of a member           | . | . | . | . | . | = | 0  | 3  | 11 |
| £5 at the death of a member's wife     | . | . | . | . | . | = | 0  | 1  | 5  |
| Annuity of 5s. weekly after age 70     | . | . | . | . | . | = | 0  | 16 | 0  |
| Total yearly payment                   | . | . | . | . | . | = | £2 | 3  | 1  |

\* See Table A S, p. 480, col. 6.

It will thus be found that while, by the former method the yearly payment would be £2 1s. 10d., by the latter plan it would be increased only 1s. 3d. yearly, but the latter would possess advantages of a very high order over the other.

First, it would exercise a salutary check on imposition and fraud. There can be no doubt that numbers often enter lodges having concealed ailments, and defects of health and constitution not easily detected; and in every such case, were it a condition or regulation of the lodge that a member providing a sickness allowance must also contribute for a deferred annuity of at least one-half the amount, a protection would be formed against the undue expenditure of the funds. For if his health be so defective as to cause him to make unusual claims on the sickness fund, that very same feature would render his life of shorter duration, and consequently give him an inferior chance of becoming an annuitant; and the loss on the one fund would be, therefore, compensated by the gain on the other.

In the second place—a gigantic institution like the Manchester Unity would reap an advantage by being thus enabled to adopt a uniform scale for all districts; for, as may have been observed in a preceding illustration, if, in the City and Town Districts, an increased amount be paid in the shape of sick allowance, it must follow that fewer claimants will arise for annuities; so that if one well developed scale were provided, it would be equally applicable to all districts. In the next place, a universality would be given to the sphere of action of the Unity, by the freedom with which the members of various trades and occupations might be admitted into the lodges. There would not then exist the same necessity for that stringent exclusion of persons of particular callings, usually thought unhealthy, as the liabilities of lodges from sickness, and from annuities, would have a constant corrective influence on each other.

The merits of this plan over that at present in force seem to be quite apparent. It will enable the lodges to determine their liabilities with more precision, and very much simplify and improve the system of management; while the members will be removed from those temptations to fraud and imposition, in the advanced periods of life, which so easily connect themselves with benefit and provident societies. On attaining 65 or 70 years of age, or any other period at which it may be agreed the annuity should commence, the member will regard it as a permanent and standing allowance; and no scheming, or pretence of sickness, can have any tendency to increase that amount; those temptations being absent, there is every reason to believe that the relative position of all parties to each other would be improved, and a higher tone of moral feeling induced, as well as a more elevated social rank in society.

According to the present scheme of the Unity, members living beyond the age of 70 have still to continue their contributions or payments as before; but the preceding plan would relieve them from that burden. Again, the human constitution, as a general rule, is then still capable of sustaining considerable labour; the annuity is equivalent to the payment of 26 weeks yearly, of full pay in sickness; but during the succeeding ten years,

the sickness will average about 20 weeks yearly, and the remaining portion of the year will therefore be open to any avocations a member may be able or choose to follow, uncontrolled by the society or the surveillance of its officers. It may not be out of place to allude here to the duty which devolves on the officers of the Order, as the organs of a great public body, to endeavour to elevate the character and improve the circumstances of its members generally. Men, if they provide for their immediate wants, are very apt to overlook every provision for the winter of life; and it is no mean expression of the prudential feelings of the working classes of this country, to find above one quarter of a million enlisted in the ranks of one great mutual-supporting institution. It is said that not more than 130,000 members of the upper and middle classes have yet availed themselves of the benefits of life assurance. What a brilliant contrast do we then find on the part of the poorer classes of the country, in the host of persons enrolled as members of one description or another of friendly societies! The officers of the Manchester Unity ought to feel themselves under high and weighty responsibilities; they are called upon to take up a grand scheme of financial reform, and to propound it in clear and calm language to the members of the Order. The whole plan of the benefits and contributions should be remodelled, on the ground of the necessity for such a step in order to secure the stability of the Unity, and the manifest advantages thence to arise to its members and their families. If the habit of discussing and of practically providing for deferred annuities were once established, the most beneficial results would follow, and those engrafted on the succeeding generation might raise the Order into one of the noblest institutions of the times.

Recently it has been attempted to puff up the merits of the Order, on its charitable features and constitution. This is a species of advocacy in which the more enlightened and recognised supporters of Odd Fellowship should cautiously avoid participating. It ought never to be lost sight of, that thousands of members hold vested rights and interests in the Unity, and that these should be satisfied before other claims can legitimately arise. "Be just before you are generous" is perhaps the best reply to such enthusiasts. The merchant or tradesman who squanders his property on charities and other purposes, however laudable in themselves, would meet with but little sympathy should he do so at the expense of his creditors. So also with the Unity: young men in the vigour of health are induced to become members, and in a few years afterwards discover that they have been entrapped into a bankrupt society, which attempts to justify its fallen condition by the liberality of its charities. With what warmth and sincerity of feeling can those persons regard such a species of management? The great question of questions is the stability of the Order; and if the essential elements of security are wanting, not only will its charities disappear, but the Unity itself, with all its boasted blessings, be forgotten with other bubbles and visionary schemes. Let the terms of membership be such as will effectually carry out all the purposes contemplated; let every member of the Unity feel warranted in stating to his friend and neighbour—"In this society is exercised the highest order of

prudential feelings; every care has been taken to justify me in asserting, that whatever is promised to our members can with certainty be fulfilled. Join us at once: our weekly or monthly payments are small, but their accumulations will afford you in after years, and during periods of sickness and distress, a comfortable support, which you can demand as the just and merited reward of your own honest and industrious savings. It is the simplest and cheapest way of guarding against the calamities of sickness and disease, and affords the only available means to a working man of providing for the vicissitudes and infirmities of old age." If every member could at the present time, in honesty and good faith so express himself,—for the hundreds that now join the Order, thousands would become members, and the Unity outgrow in magnitude the most sanguine expectations of its advocates. Charity truly "covereth a multitude of sins;" but it is much to be feared that, unless immediate measures be taken to retrieve the lavish expenditure of the Order, its too much boasted charities will, by all right-thinking men, be classed among its follies and its extravagancies.

One of the most efficient means of awakening attention to the perilous condition of the Order, would be the periodical publication of well digested records of the experience of the various lodges, from the most remote periods of which their books would admit; and a proper and skilful analysis of those, extensively circulated, could not fail to give birth to much useful conversation and debate, ultimately resulting in important and highly beneficial reforms. Science would also be greatly aided by the facts and testimony of such records, and the literature of the Order acquire an importance in the community not otherwise easily attainable. The expense to each lodge of contributing its experience would be very trifling, while the advantages to the Unity would be immense.

These remarks were written in 1845; but, from what has been stated at the beginning and in subsequent portions of this Contribution, it will be seen that the course pointed out has been strictly followed; and it is earnestly hoped that every district in the Unity will now seriously discuss the subject, and avail themselves of the information drawn from the experience of the Order. The bulk of these remarks was written about ten years ago: they have been tried by the severe test of the practical working of the lodges in the Manchester Unity itself; and it must be obvious that the suggestions originally offered for the consideration of Odd Fellows, are at the present time equally applicable to the state and condition of the Order. And although individual districts have effected considerable improvements, the greater number of them stand in as much need of redress as ever. The recent Act, the 13th and 14th Vict., cap. 115, carried through Parliament by the benevolent and public-spirited efforts of Mr. Sotheron, Member for North Wiltshire, has placed Odd Fellow societies in a much better position than formerly; and it is hoped that the legal protection now granted to them by the legislature, will also have the effect of calling attention to their financial condition, with a view of placing their monetary affairs on a stable foundation, so as to justify the friends of provident institutions in recom-

mending Odd Fellow lodges to the approval of the public. There can be no doubt that there are very few lodges in the kingdom, at present, in so hopeless a condition that, under proper guidance and advice, they might not right themselves, and yet become strong and powerful. Still, the financial condition of many is most desperate; and nothing short of immediate and strenuous efforts will suffice to place them on a safe foundation. Delay will therefore be dangerous to most, and certainly fatal to many. Let every lodge, therefore, or, if possible, each district, hold immediate meetings, to consider what effect the recent information promulgated by the Order will have on their financial condition. A patient examination of it cannot fail to convince every one of the necessity and urgent reasons of reform; and such changes should not be effected loosely, but be carried out under the advice of competent authorities accustomed to consider such questions, and devoting their attention to the practical management of benefit societies. The Odd Fellow lodges and districts which have recently made efforts to place themselves on a sound and stable foundation, have experienced no serious difficulties in doing so; and there is no reason to think that the generality of other lodges and districts would find any greater obstacles in the way of improvement.

One course, at the present juncture, is clear, and open to every member. It must appear to be his bounden duty to raise his voice against the admission of new members on any other terms than those which science and experience prove to be safe and equitable. To do otherwise, can be described in its mildest form as nothing short of a fraud on the public. It is a great, and to some extent a difficult question, to remedy the evils incidental to the Order, so far as existing members are concerned; but as to future members there cannot possibly be any doubt or difficulty. There are numerous authorities in the country calculated to give sound and trustworthy advice on the course to be followed; and why should not these be consulted at a time when the most serious alarms are sounded in every quarter? Members should calmly reflect, that the radical and scientific part of the question is neither a very simple nor a very generally understood one, even among the most highly educated classes; and it can therefore be no reflection on the intelligence of any individual member to seek for advice elsewhere.

It is quite impossible to govern the Order on sound principles under the present mode of payments. The risks incurred under different classes of members have been shewn to vary, and the difference of age at admission proved to have a great influence over the magnitude of the risks. The truth of no fact has been better established. It is therefore only just that members should pay in proportion to the risks they impose on the lodges; and under the present uniform amount of periodical contributions by members of all ages, this is rendered impossible. For if a member at age 20 be required to pay £2 7s. (see Table A S) for an allowance of £1 per week during sickness, one entering at age 40 ought to pay £4 13s. 6d. yearly; but suppose he were admitted on the same annual payment as the other, in order to compensate for the loss which the old age

would thus sustain, an entry-money or fine of no less than £41 12s. 9d. would be required; or if the allowance in sickness were only 10s. per week, one half that amount of entry-money. It is needless to remark, that it would be quite impracticable to get workmen generally to pay such sums; at younger ages the entry-money would be less, but still too high and practically exclusive. At 30 years of age the entry-money for £1 per week in sickness would be £17 8s., and for 10s. per week £8 14s.

This will be enough to expose the folly of proposing to admit members of all ages on a uniform scale of payments. No other course is open but to have rates graduated according to age. There may still, from other considerations, be an entry-money of a small amount enforced, but not sufficient to make up for the differences of age. The above illustrations apply only to the sick allowance; but if the provision or assurance at death had also entered into the question, the entry-money would have been higher, and the difficulty increased. Arrangements might also be easily made to admit of every member paying according to his means, and receiving proportionate benefits, and thus embrace every class of the community.

It is evident that the Order of Odd Fellows stands in need of much improvement; and considering that thirty-three Members of Parliament, and between six and seven hundred of the clergy, as well as many other persons of elevated rank, are said to be enrolled as members, it is remarkable that some gentleman of influence and scientific attainments should not, before this, have given attention to this lamentable condition in which his too confiding brethren of the Order are placed, and have done something to raise the Unity to the common level, at least, of the friendly societies throughout the kingdom.

It is hoped that, while the preceding observations will satisfy the members of the Manchester Unity of the great need of immediate reform, and in some degree assist in establishing their institution on a secure foundation, other friendly societies may also derive from them useful suggestions for their future guidance.

There is another class of societies which attempts to carry out the general principles of friendly societies; but they are like the Odd-Fellow Societies, modelled after the very rudest shape in which benefit clubs were formed fifty years ago: and so far as relates to their contributions and benefits, scarcely anything further is necessary to be stated. "Rechabite" is the name by which those societies are known; and every member has to come under an obligation to abstain from intoxicating liquors, and to discountenance, by every lawful means in his power, the drinking usages of society.

The terms on which members are admitted are according to the following scale:—entry money at age 16 is 5s., and at age 40 it increases to £2 10s.; the monthly contribution, for all ages, is 1s. 4d., or 17s. 4d. annually. The benefits promised are an allowance of 10s. per week in sickness, and a deferred annuity of 5s. weekly after 70 years of age. To young members entering the Rechabite societies, or tents, as they are termed, at the age of 16, the actual premium for the above benefits, making allowance for entry

money, should be £1 2s. annually; at age 40, also allowing for entry money, the annual premium should be £2 10s. 2d.

It will thus be seen, that, by the youngest member at sixteen, there is an ultimate loss of 4s. 8d. annually, and by the member aged 40 there is a loss of £1 12s. 10d. annually, provided that it were possible to sustain such losses; but it is needless to add, that permanence is not to be expected with societies so constituted. Not only do the Rechabite societies, in common with Odd-Fellow societies, perpetrate an injustice on the younger members by the above disparity in the payments; but that injustice is further augmented by levying a uniform tax of 3s. yearly, without distinction of age, for funeral money, the sum of £10 being payable on the death of each member. The discouragement given to drinking usages, and the practice of temperance enjoined by Rechabites, is deserving of every support, and is well calculated to increase the comforts and elevate the moral and political condition of the working classes; and it is the more to be regretted that the monetary foundation on which the societies are built should be destined to effect their overthrow at so early a period.

A class of societies, of which there are about two thousand in the kingdom, pass under the name of Courts of Foresters, and to the ratio of sickness experienced by them attention was directed in page 465 *ante*, their object to provide against the calamities and vicissitudes of sickness and death; members are admitted between the ages of 18 and 38, on the same terms, and participate, to the same extent, in the benefits offered. It is therefore unnecessary to add anything to what has already been remarked of Odd-Fellow and Rechabite societies, as the same observations are equally applicable to all.

The illustrations of the condition of the various grades of friendly societies, given in the preceding pages, have been made as general as possible, in order to insure their being readily understood by the members, to whom they were more particularly addressed. It will be necessary, in every instance where any practical application is made of the facts presented, to use every caution in the selection of those examples which strictly belong to the case in point; and it is hoped that the marked differences which have been shewn to prevail between the rates of mortality and sickness, under the many modifications as to condition and peculiarity of employment and rank in society, will be a sufficient guarantee against the indiscriminate use of the general results for the government of individual classes, whose circumstances differ widely.

Should these Contributions in any degree advance the science of Vital Statistics, and place the provident and self-supporting institutions of the people on a more permanent foundation, the highest wish of the writer, in venturing on so important a subject, will be consummated.

---

## AUXILIARY TABLES OF RATES AND CONTRIBUTIONS.

---

The monetary Tables given in pp. 470-81 *ante*, have an extensive application, and will be found to be exceedingly useful, but that the large body of data contained in these Contributions may be still more generally applied to all classes of provident institutions the following auxiliary Tables are given.

In pp. 205-17 *ante*, formula and examples were given for the construction of mortality Tables, and, in pp. 148-9 and 494-6, were also given formula and examples of the construction of auxiliary Tables, but these were by the direct and not the continuous mode of calculation. The determination of the figures in the D column of the preceding Tables was accomplished by an independent calculation for each result, and was not affected by those for other ages, but in the construction of the next ten Tables a continuous calculation, by the method of series, has been preferred, and the formula employed will be found in the next page. One great advantage to be derived from this method is that, if an error should enter into any step of the calculation throughout the Table, it will affect the whole of the subsequent results, and as a few minutes will suffice to perform the direct calculation for any given age by the method given in pp. 148-9 *ante*, the agreement or difference between the results of the two methods will shew whether the whole Table, by the continuous method now followed has been properly constructed or otherwise.

The explanations, formulæ, and examples furnished in pp. 544-50, in respect to the construction of auxiliary Tables on joint lives, may be usefully studied in connection with the illustrations given in the two following pages. There is also a very interesting and curious example of the practical application of the continuous method of calculation given in one of my Reports on the Bengal Military Fund, namely, that dated the 13th November, 1854.

The following formula have been employed in the formation of Tables **1** to **11** inclusive, and also with the necessary modifications in the construction of the subsequent auxiliary Table on joint lives:—

$$\begin{aligned} D_x &= l_x v^x \\ \lambda.D_x &= \lambda.l_x + \lambda.v^x \\ \Delta\lambda.D_x &= \lambda.p_x + \lambda.v = \lambda.v p_x, \text{ the values of which, at seven per} \\ &\text{cent., will be found tabulated in} \\ &\text{Table } \mathbf{12}, \text{ column 7.} \end{aligned}$$

$$\begin{aligned} \lambda.D_{x+1} &= \lambda.D_x + \Delta\lambda.D_x, \text{ and} \\ N_x &= \Sigma D_{x+1}, \text{ also in} \end{aligned}$$

|                |     |                  |                         |       |
|----------------|-----|------------------|-------------------------|-------|
| Table <b>2</b> | $v$ | $= (1.03)^{-1}$  | $\lambda.v = 9.9871627$ | 75295 |
| <b>3</b>       | $v$ | $= (1.035)^{-1}$ | $\lambda.v = 9.9850596$ | 50207 |
| <b>4</b>       | $v$ | $= (1.04)^{-1}$  | $\lambda.v = 9.9829666$ | 60701 |
| <b>5</b>       | $v$ | $= (1.045)^{-1}$ | $\lambda.v = 9.9808837$ | 09553 |
| <b>6</b>       | $v$ | $= (1.05)^{-1}$  | $\lambda.v = 9.9788107$ | 00930 |
| <b>7</b>       | $v$ | $= (1.06)^{-1}$  | $\lambda.v = 9.9746941$ | 34735 |
| <b>8</b>       | $v$ | $= (1.07)^{-1}$  | $\lambda.v = 9.9706162$ | 22315 |
| <b>9</b>       | $v$ | $= (1.08)^{-1}$  | $\lambda.v = 9.9665762$ | 44513 |
| <b>10</b>      | $v$ | $= (1.09)^{-1}$  | $\lambda.v = 9.9625735$ | 02059 |
| <b>11</b>      | $v$ | $= (1.10)^{-1}$  | $\lambda.v = 9.9586073$ | 14842 |

$l_x$  = Number living at the age  $x$  in the second column of Table C (Males), pp. 5-6 *ante*.

Also  $v^x$  = Present value of £1 due  $x$  years hence.

In order, however, to simplify the construction of Tables **2** to **11** inclusive and also the subsequent Tables on joint lives, a Table, of which the following is a specimen, was formed to determine

$\lambda.p_x = \lambda.l_{x+1} - \lambda.l_x$ ;  $\lambda.p_x$  is constant for the same age throughout the whole of the Tables at whatever rate of interest they may be calculated.

$$\Delta\lambda.p_x = \lambda.p_{x+1} - \lambda.p_x$$

$$\lambda'.p_x = \text{co. log. } p_x$$

$$\Delta\lambda'.p_x = \lambda'.p_{x+1} - \lambda'.p_x$$

$p_x$  = Probability of living one year at age  $x$ .

The successive  $\lambda.D_x$  in the following Tables were produced by the continuous addition to the initial  $\lambda.D_x$  at the top of each column of  $\lambda.p_x$ , and also the constant  $\lambda.v$ ; but the same would obviously have been accomplished by the continuous addition of simply  $\lambda.v p_x$ , the values of which, at seven per cent., will be found in Table **12**, column 7.

TABLE 1,

Being preliminary to the Construction of Tables 2-11 inclusive.

| Age<br>$x$ | $l_x$  | $\lambda.l_x$ | $\lambda.p_x$ | $\Delta.\lambda.p_x$ | $\lambda'.p_x$ | $\Delta\lambda'.p_x$ | $\lambda.v^x = \lambda.(1.07)^x$ | Age<br>$x$ |

After this explanation the "headings" of the different Tables will sufficiently shew the other details of their construction. The various Tables were, at frequent intervals during the progress of their formation by the preceding method, checked by the direct mode of calculation employed in forming Table VI, page 149 and Table A U, page 494, ante.

TABLE 2.

*England and Wales.—Whole Population.—Single Lives.—Males.—Three per Cent.*

In pp. 532 *ante*, were given the formulæ employed in the construction of the auxiliary Tables 2 to 11 inclusive, and with but slight modifications the same are applicable to the formation of Tables on joint lives. It may, however, be convenient for many purposes to give the formulæ more in detail, by which the following Tables were formed. The rate of interest at which they are calculated, it will be observed, is seven per cent. The reason for adopting this rate is, that there are frequently contingent life interests and reversions disposed of, the market price of which is regulated by as high a rate of interest, and there being no published Tables on joint lives calculated at a higher rate than six per cent., it is believed that the following Tables will be found useful, not only in regard to such matters, but in respect to many other questions of a more general and public nature. Whenever occasion may arise for the determination of the value of contingent life interests at other rates of interest, such may be done from the following Tables by a simple mode of approximation, the formula for which is hereafter given, and its application may be safely relied on for all practical purposes.

The following, viewed in connection with the explanations already furnished in pp. 532-3 *ante*, will shew the conditions and formulæ on which the construction of the following auxiliary Tables on joint lives depends:—

Let  $l_x$  = Number living at age  $x$  in the second column of Table C (Males), pp. 5-6 *ante*, and

$l_y$  = Number living at age  $y$  in the same Table; also

$p_{x,y}$  = Probability of the joint survivorship of two lives aged  $x$  and  $y$  for one year; and likewise

$r$  = 0.07, seven per cent. being the rate of interest adopted in the calculation of the following Tables.

$1+r$  = 1.07,  $\lambda.(1+r) = 0.02938378$ , and therefore  $\frac{1}{2}\lambda.(1+r) = 0.01469189$ .

$v = \frac{1}{1+r} = .9345794 \quad 39252$  being the present value of £1 due one year hence, consequently

$\lambda.v = 9.9706162$ , and therefore  $\lambda.\sqrt{v} = \frac{1}{2}\lambda.v = \frac{1}{2}\lambda.\left(\frac{1}{1.07}\right) = 9.9853081 \quad 1157$ .

$v^{\frac{1}{2}} = \frac{1}{1+\frac{r}{2}} = \frac{1}{1.035} = .9661835 \quad 65217$  being the present value of £1 due six months hence, and therefore

$\lambda.v^{\frac{1}{2}} = \left(\frac{1}{1+\frac{r}{2}}\right) = \lambda.\left(\frac{1}{1.035}\right) = \lambda'.1.035 = 9.9850596 \quad 50207$ , which is not to be confounded with  $\frac{1}{2}\lambda.v$ , the quantity employed in the determination of the vertical series hereafter referred to.

Then in the following Auxiliary Tables will

$$(1) \quad D_{x,y} = l_x.l_y.v^{\frac{1}{2}(x+y)} = l_{x,y}.v^{\frac{1}{2}(x+y)}$$

$$D_{x,y+1} = l_{x,y+1}.v^{\frac{1}{2}(x+y+1)} \quad \text{and therefore}$$

$$\frac{D_{x,y}}{D_{x,y+1}} = \frac{1}{\sqrt{v}.p_y} \quad \text{and}$$

$$(2) \quad \lambda.D_{x,y} = \lambda.D_{x,y+1} + \lambda'.\sqrt{v}.p_y = \lambda.D_{x,y+1} + \lambda'.p_y + \frac{1}{2}\lambda.(1+r)$$

Again  $\lambda.D_{x,y+1} = \lambda.D_{x,y} + \Delta\lambda.D_{x,y}$ , but

$$\Delta\lambda.D_{x,y} = \lambda.p_y + \frac{1}{2}\lambda.v, \quad \text{and therefore}$$

$$(3) \quad \lambda.D_{x,y+1} = \lambda.D_{x,y} + \lambda.p_y + \frac{1}{2}\lambda.v, \quad \text{or}$$

$$(4) \quad \lambda.D_{x,y+1} = \lambda.D_{x,y} - (\lambda'.p_y + \frac{1}{2}\lambda'.v), \quad \text{and also}$$

$$(5) \quad \lambda.D_{x,y+1} = \lambda.D_{x,y} - (\lambda'.p_y - \frac{1}{2}\lambda.v). \quad \text{On referring to page 532 } \textit{ante}, \text{ it will be seen that}$$

$$\lambda.p_{x,y} = \lambda.p_x + \lambda.p_y, \quad \text{and also}$$

$$\Delta\lambda.p_{x,y} = \Delta\lambda.p_y, \quad x \text{ in the series being constant, therefore}$$

$$\lambda.p_{x,y+1} = \lambda.p_{x,y} + \lambda.p_y.$$

In the above formulæ it is assumed in the determination of the successive differences that one of the ages,  $x$ , remains constant and the other,  $y$ , is by each step in the manipulation varied one year, and as applied to Table 13 will always vary vertically. In the practical construction of such Tables as the following there are many reasons in favour of such a mode of calculation, from its less liability to manual errors, but the same principles may be applied in the formation of Tables by a continuous series in which the result of each step in the order of differences will determine the values for a variation of one year in the age of each of the two lives, as follows, and as applied to Table 13 will vary horizontally.

$$(6) \quad \lambda.D_{(x,y)+1} = \lambda.D_{x,y} + \lambda.v.p_{x,y}, \quad \text{or}$$

$$(7) \quad \lambda.D_{(x,y)+1} = \lambda.D_{x,y} + \lambda.v.p_x + \lambda.p_y \quad \text{and}$$

$$(8) \quad \lambda.D_{(x,y)+1} = \lambda.D_{x,y} + \lambda.p_x + \lambda.p_y + \lambda.v; \quad \text{in like manner}$$

$$(9) \quad \lambda.D_{x,y} = \lambda.D_{(x,y)+1} + \lambda'.v.p_{x,y}, \quad \text{or}$$

$$(10) \quad \lambda.D_{x,y} = \lambda.D_{(x,y)+1} + \lambda'.v.p_x + \lambda'.p_y \quad \text{and also}$$

$$(11) \quad \lambda.D_{x,y} = \lambda.D_{(x,y)+1} + \lambda'.p_x + \lambda'.p_y + \lambda'.v.$$

The preceding formulæ furnish various modes by which to construct auxiliary Tables according to the continuous method of calculation. The most convenient formula will depend on the nature and extent of the preliminary Tables which may have been prepared for facilitating the final calculation in which the value of  $\lambda.D_{x,y}$  is to be determined. In the preliminary Table 12, page 546 *ante*, will be found all the elements which enter into the above formulæ, and should no further combination of them be made there can be very little difference between the facilities in calculation offered by the expressions (2) to (5) inclusive. Each of the series of results, it will be seen, is produced by the successive additions or subtractions from the initial  $\lambda.D_{x,y}$ , with which the series begins, of two other quantities, but if these two quantities were combined the subsequent process of calculation would be shortened, and the values determined, by the continued addition or subtraction of only one quantity. The following preliminary Table contains the elements so combined according to the preceding methods of finding the successive values of  $\lambda.D_{x,y}$ .

TABLE 12.

*Being preliminary to the construction of Tables 13 and 14.*

In columns (4) (5) of the preceding Table will be found the vertical differences by which the whole of the Tables, of which Table **13** is a specimen, were calculated. The successive values of the expression  $\lambda.p_y - \frac{1}{2}\lambda.v$  for each age, were written on a perforated slip of paper, and the initial  $\lambda.D_{x,y}$ , or the first at the top of each column in Table **13** having been determined from  $D_{x,y} = l_{x,y} \cdot v^{\frac{1}{2}(x+y)}$ , the subsequent values of  $\lambda.D_{x,y}$  in each column were produced by deducting the corresponding quantities to the given difference of age on the perforated slip. The same slip of course served for the whole range of the Table, whatever the disparity of age. For example, if from the initial  $\lambda.D_{x,y} = 4.7061622$  in the first column headed "Age" 10, Table **13**, there be, in succession, deducted the quantities in the same order given in column (4), (5) of the preceding Table **12**, the results will be found to produce the successive values in Table **13**, in that column, and the figures, in the same perforated slip, if deducted from the initial quantity in column "Age" 11, beginning also with age 11 on the slip, will, in succession, produce all the results in that column, and so, in like manner, will the results in all the other columns of Table **13** be produced. One of the advantages, independent of the reduced amount of labour of the present over the direct method of calculation followed in constructing the Tables in pp. 148 and 494 *ante* is, that if at any step of the process an error should be made, it must affect all the subsequent results, and, therefore, the correctness of any one series of the Tables may be easily tested by calculating, at an advanced stage of it, the value of  $\lambda.D_{x,y}$  by the direct method. Thus,  $\lambda.D_{x,y}$  in column "Age" 10, for disparity of 90 years, or for ages 10-100, is found directly from the expression  $l_{x,y} \cdot v^{\frac{1}{2}(x+y)}$ .

| In Table <b>1</b> | $\lambda.l_x$                  | $= \lambda.l_{10}$                                   | $=$ | 5.0000000        |
| ...               | $\lambda.l_y$                  | $= \lambda.l_{100}$                                  | $=$ | 1.5440680        |
| ...               | $\lambda.v^{\frac{1}{2}(x+y)}$ | $= \lambda.v^{\frac{1}{2}(10+100)} = \lambda.v^{55}$ | $=$ | 8.3838922        |
| ...               | $\lambda.D_{x,y}$              | $= \lambda.D_{10,100}$                               | $=$ | 4.9279602, which |

agrees with the results of Table **13**, only that the index in that Table has been reduced by 5, in order to condense the figures in the final Table **14**. It is therefore to be presumed that all the results in the same column are correct. It is possible, however, that compensating errors may have arisen, but the chances of errors which shall exactly balance each other are very remote, but, to guard against such a contingency, it is prudent to check the results by performing the direct calculation at four or five intervals throughout the column, or, what is still a better test, would be to go over the whole of the figures in the column with a second perforated slip, prepared in accordance with formula (3), as given in column (3) Table **12**, in which the expression  $\lambda.p_y + \frac{1}{2}\lambda.v$  is additive, while that actually employed in the original construction of the Table was subtractive. This, carefully done, will always ensure complete accuracy.

TABLE 13.

*(The characteristic in each of the quantities  $\lambda.D_{x,y}$  has been diminished by 5.)*

An attentive examination of the preceding formulæ, and the construction of Tables **12** and **13**, will suggest a variety of means by which tests may be applied to ensure the correctness of the quantities  $\lambda.D_{x,y}$  in the latter Table. One which will be found very simple and convenient is in the application of  $\lambda.p_x + \frac{1}{2}\lambda.v$ , and which is tabulated in column (3) Table **12**, as  $\lambda.p_y + \frac{1}{2}\lambda.v$ ,  $x$  in the series now under consideration being constant, and taking the place of  $y$  in that column. If then  $\lambda.p_x + \frac{1}{2}\lambda.v$  be continuously added to the results in any one column of Table **13**, it will always produce the  $\lambda.D_{x,y}$  in the next column, one place higher in order; for example,  $\lambda.p_{10} + \frac{1}{2}\lambda.v = 9.9818592$  if added to any quantity in column "Age" 10, Table **13**, will produce  $\lambda.D_{x,y}$  in column "Age" 11, but one place higher in order. In like manner will  $\lambda.p_{15} + \frac{1}{2}\lambda.v = 9.9827782$ , if added to the figures in column "Age" 15, produce the results in column "Age" 16, but one place higher in order.

The whole of the series of Tables, of which Table **13** is a specimen, having been calculated according to the formulæ already pointed out, and various modes of verification employed to test the accuracy of the results, the next step was to find the natural numbers of  $\lambda.D_{x,y}$ . This having been done, the values of  $\lambda.D_{x,y}$ , taken horizontally from Table **13**, were arranged vertically, in the same order, in Table **14**, and will be found in the various columns headed  $D_{x,y}$  in that Table. The whole of the enlarged Table **14** being so far completed, the adjacent column in the same Table was formed from the expression

$$N_{x,y} = \Sigma D_{x,y}$$

In this manner has Table **14** been constructed, and all the results verified throughout.

In calculating the Auxiliary Tables, in pp. 148 and 494 *ante*, by the direct method, the use of logarithms, to five decimal places, would have been sufficient for all practical purposes, but by the continuous method followed in the construction of Tables **1** to **14** inclusive, where the results are determined by successive additions of constant quantities to an initial value, any original inaccuracy in these constants is increased at each step, and becomes magnified to a great extent at the end of the series. Extreme care is therefore necessary in the formation of the preliminary Table **12**, page 546, and particularly in regard to the constants  $\lambda.(1+r)$ ,  $\frac{1}{2}\lambda.v$ ,  $\frac{1}{2}\lambda'.v$  and  $\lambda'.v$ , all of which may be derived from  $\lambda.v$ . In page 532 *ante* will be found, for ten different rates of interest, the  $\lambda.v$  to twelve places of decimals calculated with the Logarithms in the large edition of Vega, and will meet most cases which are likely to arise, but should the  $\lambda.v$  for intermediate rates of interest, or for higher or lower rates than those given in page 532 be required, they may be found in a few minutes by those not having at hand Tables of Logarithms to more than seven places, by the following formula. As the same necessity exists for accuracy in the use of the  $\lambda.v^x$ , given in the eighth column of Table **1**, page 533, a complete Table of the  $\lambda.v^x$ , from  $\lambda.v_1$ , to  $\lambda.v_{110}$ , for ten different rates of interest and to twelve places of decimals, will be found in a Table in the subsequent pages of this Contribution.

| 22                           | 70   | 1467.7    | 9452.68   |       |      |           |           |                              |      |           |           |       |      |           |           |

It has already been said, that in the continuous method of constructing auxiliary Tables there is a necessity for the logarithms being carried to more decimal places than by the direct process; but generally seven places will ensure accuracy, provided care be taken in the determination of  $\lambda.v$ , and this may be done with complete accuracy to as many places as are required by the following formula:—

According to the logarithmic theorem

$$\text{Log. } (1+k) = m_1 k + m_2 k^2 + m_3 k^3 + m_4 k^4 + m_5 k^5 + \&c. = (A).$$

If in the first member of this equation  $k=0$  then  $\lambda.(1+k) = \lambda.1$  and the expansion will not contain any term independent of  $k$ .

If  $k$  be converted into  $k+z$ , then

$$\lambda.(1+k+z) = m_1(k+z) + m_2(k+z)^2 + m_3(k+z)^3 + \&c. = (B).$$

$$\text{But } 1+k+z = (1+k) \cdot \left(1 + \frac{1}{1+k} z\right), \text{ therefore}$$

$$\lambda.(1+k+z) = \lambda.(1+k) + \lambda \cdot \left(1 + \frac{1}{1+k} z\right)$$

Hence by equation (A)

$$\lambda.(1+k+z) = m_1 k + m_2 k^2 + \&c. + m_1 \frac{1}{1+k} z + m_2 \left(\frac{1}{1+k}\right)^2 z^2 + \&c. = (C).$$

The second member of this equation must be equal to the second member of equation (B), and by applying the binomial theorem the complete co-efficient of  $z$  in (B) is evidently

$$m_1 + 2 m_2 k + 3 m_3 k^2 + 4 m_4 k^3 + \&c.$$

This must correspond with the complete co-efficient of  $z$  in equation (C) which is

$$m_1 \frac{1}{1+k} = m_1 - m_1 k + m_1 k^2 - m_1 k^3 + \&c.$$

In equation (C) the terms beyond this contain only the higher powers of  $z$ , and these two expressions being the same it therefore follows that

$$m_1 = m_1$$

$$2 m_2 = -m_1 \text{ and therefore } m_2 = -\frac{1}{2} m_1$$

$$3 m_3 = +m_1 \quad \dots \quad m_3 = +\frac{1}{3} m_1$$

$$4 m_4 = -m_1 \quad \dots \quad m_4 = -\frac{1}{4} m_1$$

$$5 m_5 = +m_1 \quad \dots \quad m_5 = +\frac{1}{5} m_1$$

$$6 m_6 = -m_1 \quad \dots \quad m_6 = -\frac{1}{6} m_1$$

$$\&c. \quad + \&c. \quad \dots \quad \&c. \quad + \&c. \text{ consequently}$$

$$\lambda.(1+k) = m_1 \left( k - \frac{k^2}{2} + \frac{k^3}{3} - \frac{k^4}{4} + \frac{k^5}{5} - \frac{k^6}{6} + \&c. \right)$$

and which produces the logarithm of  $1+k$ ; but the symbol  $m_1$  employed above being the modulus of the system of logarithms, the results of the last equation will give either common or Napierian logarithms according as

$$m_1 = 1 = \text{modulus of the Napierian system, or}$$

$$m_1 = \frac{\text{Com. } \lambda.10}{\text{Nap. } \lambda.10} = \frac{1}{2.3025851} = .434294481903 = \text{modulus of ordinary logarithms.}$$

Hence in the Napierian system

$$\text{Log.}_e (1+k) = k - \frac{k^2}{2} + \frac{k^3}{3} - \frac{k^4}{4} + \frac{k^5}{5} - \frac{k^6}{6} + \frac{k^7}{7} - \frac{k^8}{8} + \dots$$

This series is always true when  $k$  is not greater than 1; it converges slowly when  $k = 1$ , and more rapidly as  $k$  becomes smaller. In the determination of  $\lambda.v$  it will almost always happen that  $k$  is a small fraction, and then the series above given is rapidly convergent.

Ten per cent., for example, is the highest rate of interest entering into the construction of the preceding Tables, and in that case

$$v = \frac{1}{1+r} = \frac{1}{1.1}$$

Hence to find  $\log_e (1.1)$  make  $k = .1$ , then

$$\text{Log}_e (1.1) = .1 - \frac{.01}{2} + \frac{.001}{3} - \frac{.0001}{4} + \frac{.00001}{5} - \frac{.000001}{6} + \dots$$

These terms may be extended as far as necessary and when arranged for summation the following results are obtained:—

$$\begin{array}{rcl}
 & + \left\{ \begin{array}{l} .1 \\ .00033333333333 \\ .00000200000000 \\ .00000001428571 \\ .00000000011111 \\ .00000000000091 \end{array} \right. & \\
 & + .10033534773106 & \\
 & - \left\{ \begin{array}{l} .005 \\ 000025 \\ .00000016666667 \\ .00000000125000 \\ .00000000001000 \\ .00000000000008 \end{array} \right. & \\
 & - .00502516792675 &
 \end{array}$$

$$\text{Whence } \text{Log}_e (1.1) = (.10033534773106 - .00502516792675) = 0.09531017980431.$$

This result, which is the natural or Napierian logarithm, is correct to the thirteenth decimal inclusive, and if multiplied by the modulus .434294481903, will be reduced to the ordinary base. Therefore

$$\lambda.(1+r) = \lambda.(1.1) = (0.09531017980431 \times .434294481903) = 0.041392685158$$

$$\text{and } \lambda.v = \lambda.\left(\frac{1}{1+r}\right) = \lambda.\left(\frac{1}{1.1}\right) = 9.958607314842, \text{ which agrees exactly with the value given in page 532, and also that in Table 15 following.}$$

To find  $\text{Log}_e (1.07)$  make  $k = .07$  and

$$\text{Log}_e (1.07) = .07 - \frac{.0049}{2} + \frac{.000343}{3} - \frac{.00002401}{4} + \frac{.0000016807}{5} - \dots$$

the summation of which produces

$$\begin{array}{rcl}
 & + \left\{ \begin{array}{l} .07 \\ .000114333333 \\ .000000336140 \\ .00000000117649 \\ .00000000000448 \end{array} \right. & \\
 & + .07011467065397 & \\
 & - \left\{ \begin{array}{l} .00245 \\ .0000060025 \\ .00000001960817 \\ .00000000007206 \\ .00000000000028 \end{array} \right. & \\
 & - .00245602218051 &
 \end{array}$$

$$\text{and } \text{Log}_e (1.07) = (.07011467065397 - .00245602218051) = 0.06765864847346$$

consequently

$$\lambda.(1+r) = \lambda.(1.07) = (0.06765864847346 \times .434294481903) = 0.029383777685$$

$$\text{and } \lambda.v = \lambda.\left(\frac{1}{1+r}\right) = \lambda.\left(\frac{1}{1.07}\right) = 9.970616222315.$$

This, it will be seen, has been determined correctly to twelve places of decimals by the employment of ten terms in the above series. If, however, eight terms only had

been employed the result would have been correct for eleven decimal places, and the twelfth place would have been two units only in error, producing 7 instead of 5 as above.

Again, to find  $\text{Log}_e(1.03)$  make  $k = .03$  and

$$\text{Log}_e(1.03) = .03 - \frac{.0009}{2} + \frac{.000027}{3} - \frac{.00000081}{4} + \frac{.0000000243}{5} - \frac{.000000000729}{6} + \dots$$

the summation of which gives

$$\begin{array}{rcl} & + \left\{ \begin{array}{l} .03 \\ .000009 \\ .00000000486 \end{array} \right. & - \left\{ \begin{array}{l} .00045 \\ .0000002025 \\ .00000000012 \end{array} \right. \\ + .03000900486 & & - .00045020262 \quad \text{and} \end{array}$$

$$\text{Log}_e(1.03) = (.03000900486 - .00045020262) = 0.02955880224, \quad \text{and hence}$$

$$\lambda.(1+r) = \lambda.(1.03) = (0.02955880224 \times .434294481903) = 0.012837224705; \quad \text{and therefore}$$

$$\lambda.v = \lambda.\left(\frac{1}{1+r}\right) = \lambda.\left(\frac{1}{1.03}\right) = 9.987162775295,$$

agreeing with the result in page 532, as well as with that in Table 15 following, although the calculation has been limited to six terms of the series only. It is therefore obvious that as the value of the fraction  $k$  diminishes the series becomes rapidly convergent. In the first of the preceding examples where  $k = .1$  the series consisted of twelve terms, but in the last, in which  $k = .03$  it was formed of six terms only, but it in each case gives  $\lambda.v$  correct to twelve places.

Having in this manner found  $\lambda.v$  for each rate of interest specified in page 532, the following Table, containing the logarithms to twelve places of decimals, of the present value of £1 due at the end of any number of years from one to 110 years, has been calculated for ten different rates of interest. As this Table is of extensive application in all matters connected with life contingencies every care has been taken to ensure its accuracy. It has been calculated in duplicate by the following formula, and as a further check on the results so obtained a third calculation was made by a different formula.

It will have been observed that  $\lambda.v$  is simply the arithmetical complement of  $\lambda.(1+r)$ . These two values having, as already stated, been found for each rate of interest by the logarithmic formula given above, it will be seen that in the next Table

$$\lambda.v^x = \lambda.\frac{1}{(1+r)^x} = \lambda.\frac{1}{(1+r)^{x-1}} - \lambda.(1+r) \quad \text{or}$$

$$\lambda.v^{x-1} = \lambda.v^x + \lambda.(1+r);$$

But  $\lambda.(1+r)$  being constant its continuous addition to the initial  $\lambda.v$  will produce the successive values in the different columns of the following Table:—

*Log. of the Present Value of £.1, due at the end of any number of Years.*

| YEARS. | 3 PER CENT. |       | 3½ PER CENT. |       | 4 PER CENT. |       | 4½ PER CENT. |       | 5 PER CENT. |       |
|--------|-------------|-------|--------------|-------|-------------|-------|--------------|-------|-------------|-------|

The use of the five Table **16**, **17**, **18**, **19**, and **20**, immediately preceding will be sufficiently understood from the explanations given in pp. 495-6, 532-3, and pp. 544-9 *ante*. It will be observed that by the aid of column N<sup>s</sup> the values of Sickness Benefits are determined with the same facility as ordinary questions of life contingencies are solved by means of the usual N columns. Examples and formula will be found in page 496 *ante*. The results in Tables A H to A N inclusive, and in Tables A Q to A S inclusive, were determined by the ordinary method of calculating annuities, and not by the Commutation System of Barrett, on which the five preceding Tables were constructed.

The formula by which the values of the Sickness Benefits in Tables A G to A S inclusive were formed are given in page 486. The Commutation System however, as appears from the following examples, offers much greater facilities for the solution of the more complicated questions.

*The following Examples shew the differences between the values arrived at by the two series of Tables.*

The Tables in pp. 470-80 *ante* are all calculated at three per cent. interest, but by the five tables in pp. 582-91 questions may be solved at not only 3 but also  $3\frac{1}{2}$ , 4,  $4\frac{1}{2}$ , and 5 per cent. interest. Although so high a rate as 5 per cent. is seldom realized by Friendly or Benefit Societies still there are a few instances, such as the Society in connection with Mr. Beaumont's Lead Mines, which is under the guidance of Mr. Sopwith, so favourably known in scientific and philanthropic circles, there is the Society formed by the workmen on the London and South-Western Railway and others, in all of which the employers guarantee this high rate of interest. There is also the likelihood at present of other extensive employers granting similar encouragement to the formation of Friendly Societies amongst their workmen, and in every such instance the present tables will be found highly useful as well as important in the solution of questions of a merely curious and speculative character.

It was remarked in page 544 *ante*, that whenever occasion arose for the valuation of Life Contingencies at other rates of interest than those on which the preceding Tables are calculated, it could be done by a simple mode of approximation. In Mr. Thomson's Actuarial Tables, page 13, a method is suggested of adding the successive logarithmic differences between the known and the required rate of interest to the logarithms of the successive values of temporary annuities from the given age to the extreme of the Table, and then affecting the summation of the natural numbers of the results. For short period annuities, whether deferred or immediate, and with the aid of Mr. Thomson's Table IV, the plan is both simple and convenient, but for whole life immediate annuities, except at very advanced ages, the method is very tedious and irksome. The following mode of approximation, the demonstration of which is given in a very elegant form by Mr. Bullen in the "Post Magazine" for November 16th, 1850, will be found exceedingly convenient and useful in every case in which a table has been formed by the Commutation System at only one rate of interest, and a ready means is required by which to determine the corresponding values of annuities at other rates of interest.

In order to shew its practical utility and the extent to which the results arrived at by such means of approximation may be relied on, let it be assumed that of the series of ten Tables, 2 to 11 inclusive, pp. 534-43, only one had been actually constructed, namely, that for 5 per cent., and that it is required to find by approximation the values of annuities according to the rates of interest on which each of the remaining nine Tables of the series was calculated. If this were done and the results compared with the values obtained by direct calculation, it would enable any one to judge how far the method is applicable for the purpose proposed.

Table 6, page 538, having been formed,

Let  $r$  = Rate of interest on which the Commutation Table has been formed,

$r'$  = Rate of interest for which the value of the Annuity is required. Also let

$a_x$  = Value of an Annuity of £.1 at age  $x$ , according to the Commutation Table which has been actually constructed, and

$a'_x$  = Corresponding value of an Annuity of £.1 at age  $x$  for the required rate of interest.

Then if the summation of Column N in the Commutation Table which has been formed be continued in another series of Columns, so that

$$^1N_x = \Sigma N_x$$

$$^2N_x = \Sigma ^1N_{x+1}$$

$$^3N_x = \Sigma ^2N_{x+1}$$

$$^4N_x = \Sigma ^3N_{x+1} \text{ and}$$

$$^nN_x = \Sigma ^{n-1}N_{x+1} \text{ then will}$$

$$a'_x = a_x - \frac{^1N_x}{D_x} \cdot k + \frac{^2N_x}{D_x} \cdot k^2 - \frac{^3N_x}{D_x} \cdot k^3 + \frac{^4N_x}{D_x} \cdot k^4 \text{ \&c. \&c. . . . (1)}$$

$$\text{In which } k = \frac{r' - r}{1 + r'}$$

If, however, in the equation we make

$$\frac{^1N_x}{D_x} = A_x$$

$$\frac{^2N_x}{D_x} = B_x$$

$$\frac{^3N_x}{D_x} = C_x, \text{ \&c. \&c. \&c. then will}$$

$$a'_x = a_x - A_x \cdot k + B_x \cdot k^2 - C_x \cdot k^3 + D_x \cdot k^4 - \text{\&c. \&c. . . . . (2)}$$

As the quantity  $k$  will always be a very small fraction, and therefore, as in page 575, rapidly converge, more than four terms will seldom be required in the series.

The following Abstract will shew the manner in which the quantities  $^1N_x$ ,  $^2N_x$ ,  $^3N_x$ , &c. &c. are derived from Table 6, page 538.

Abstract showing the Process of Finding the Coefficients  ${}^1N_x$ ,  ${}^2N_x$ ,  ${}^3N_x$ , &c. &c., from TABLE 6.

| 106        | .0056746<br>7.7539343   |                         |                          |                           |                            |                             |

If from the logs. of the above coefficients  ${}^1N_x$ ,  ${}^2N_x$ ,  ${}^3N_x$ , &c. be subtracted the corresponding  $\lambda. D_x$  there will be produced  $\lambda. A_x$ ,  $\lambda. B_x$ ,  $\lambda. C_x$ , and  $\lambda. D_x$ , which form the fourth, fifth, sixth, and seventh columns of Table 21, and afford a ready means of solving Equation (2) preceding.

It will be observed that, for the same rate of interest,  $k$  is constant for every age in the Table, and as the logs. of the first four powers of  $k$  may be written on a slip of paper, so as to cover precisely the spaces occupied by the fourth, fifth, sixth, and seventh columns of Table **21**, it will be easy to write down by inspection the sum of the logs. of both factors in each term of Equation (2), namely,

$$\lambda.A_x.k, \lambda.B_x.k^2, \lambda.C_x.k^3, \text{ and } \lambda.D_x.k^4$$

without writing the log. of each factor separately, and by this means the value of the annuity  $a'_x$  is speedily obtained. For example, in the case now under consideration,

$r = .05$ , and in order to find the values of Annuities at Six per Cent.

$$\frac{r' - r}{1 + r'} = \frac{.06 - .05}{1 + .06} = \frac{1}{106} = .0094340 = k \text{ which is constant for finding all values at Six per Cent. In like manner will}$$

$$\frac{r' - r}{1 + r'} = \frac{.07 - .05}{1 + .07} = \frac{2}{107} = .0186916 = k \text{ at Seven per Cent., and which is of course constant, and in a similar manner for any other rate of interest, say Ten per Cent.}$$

$$\frac{r' - r}{1 + r'} = \frac{.10 - .05}{1 + .10} = \frac{5}{110} = .0454545 = k \text{ at Ten per Cent., and is constant for that rate of interest.}$$

If in order, therefore, to avoid writing the logs. of both factors in each member of Equation (2), the logs. of the first four powers of  $k$  for each difference in the rate of interest were previously prepared and neatly written on slips of paper, so that they might be placed exactly superincumbent on the columns  $\lambda.A_x$ ,  $\lambda.B_x$ ,  $\lambda.C_x$ , and  $\lambda.D_x$  of Table **21**, addition may be performed by inspection, and the sum of the logs. of both factors written down at once, by which the values of Annuities, at any rate of interest, are obtained with little more trouble than that required to find them directly from a Commutation Table constructed for the particular rate of interest.

The following logs., as arranged in horizontal lines, will be constant for all ages, when a Commutation Table has been calculated at Five per Cent., and it is required to derive from it the values of corresponding Annuities at

|    |                              | $\lambda.k$ | $\lambda.k^2$ | $\lambda.k^3$ | $\lambda.k^4$ |

| 106 |         |                                                            |             |               |               |               | 106 |

This much being explained, the means are now given by which to test the practical merits of this mode of approximating to the values of Annuities.

For example, if it were required to find the value of an Annuity at any age  $x$ , say age 40, assuming the rate of interest Six per Cent., then the process of calculation is as follows:—

$$\lambda.A_x = 2.2010889$$

$$\lambda.k = 7.9746942$$

$$0.1757831 = - \quad 1.49894 = A_x.k$$

$$\lambda.C_x = 4.0489164$$

$$\lambda.k^3 = 3.9240826$$

$$7.9729990 = - \quad .00940 = C_x.k^3$$

$$- \quad 1.50834 = (A_x.k) + (C_x.k^3)$$

$$+ \quad .12994$$

$$- \quad 1.37840$$

$$a_{40} \text{ at 5 per cent.} = \quad 13.35638$$

$$11.97798 = a'_{40} \text{ at 6 per cent. by approximation.}$$

$$11.97794 = a_{40} \text{ at 6 per cent. by direct calculation from Table 7.}$$

$$\lambda.B_x = 3.1623743$$

$$\lambda.k^2 = 5.9493884$$

$$9.1117627 = + \quad .12935 = B_x.k^2$$

$$\lambda.D_x = 4.8687331$$

$$\lambda.k^4 = 1.8987768$$

$$6.7675099 = + \quad .00059 = D_x.k^4$$

$$+ \quad .12994 = (B_x.k^2) + (D_x.k^4)$$

In this example the logarithms of the two factors  $A_x.k$  &c. &c. are kept separate, but as already stated, this is unnecessary, as it is easy for any one accustomed to calculations of the sort to write down at once the sum of the logarithms by inspection as follows:—

$$\lambda.A_x.k = 0.1757831 = - \quad 1.49849 = A_x.k$$

$$\lambda.C_x.k^3 = 7.9729990 = - \quad .00940 = C_x.k^3$$

$$- \quad 1.50834 = (A_x.k) + (C_x.k^3)$$

$$+ \quad .12994$$

$$- \quad 1.37840$$

$$a_{40} \text{ at 5 per cent.} = \quad 13.35638$$

$$11.97798 = a'_{40} \text{ at 6 per cent. by approximation.}$$

$$11.97794 = a_{40} \text{ at 6 per cent. by direct calculation from Table 7.}$$

$$\lambda.B_x.k^2 = 9.1117627 = + \quad .12935 = B_x.k^2$$

$$\lambda.D_x.k^4 = 6.7675099 = + \quad .00059 = D_x.k^4$$

$$+ \quad .12994 = (B_x.k^2) + (D_x.k^4)$$

$$\lambda.A_x.k = 0.4727351 = - \quad 2.96985 = A_x.k$$

$$\lambda.C_x.k^3 = 8.8638550 = - \quad .07309 = C_x.k^3$$

$$- \quad 3.04294 = (A_x.k) + (C_x.k^3)$$

$$+ \quad .51679$$

$$- \quad 2.52615$$

$$a_{40} \text{ at 5 per cent.} = \quad 13.35638$$

$$10.83023 = a'_{40} \text{ at 7 per cent. by approximation.}$$

$$10.82934 = a_{40} \text{ at 7 per cent. by direct calculation from Table 8.}$$

$$\lambda.B_x.k^2 = 9.7056667 = + \quad .50777 = B_x.k^2$$

$$\lambda.D_x.k^4 = 7.9553179 = + \quad .00902 = D_x.k^4$$

$$+ \quad .51679 = (B_x.k^2) + (D_x.k^4)$$

$$\begin{aligned}

 & & & + 3.31835 \\
 & & & - 4.95491 \\
 a_{40} \text{ at 5 per cent.} &= 13.35638 & 8.40147 &= a'_{40} \text{ at 10 per cent. by approximation.} \\
 & & 8.33469 &= a_{40} \text{ at 10 per cent. by direct calculation from Table 11.}
 \end{aligned}$$

In the next place when it is required to find the values of annuities at a less rate of interest than that on which the Commutation Table has been constructed, it is obvious that  $k$  being in this case a negative quantity the signs of all the terms of the series in Equation (2) page 595, will be positive, thus

$$a'_x = a_x + A_x.k + B_x.k^2 + C_x.k^3 + D_x.k^4 + \&c. \&c.$$

Hence to find the value of an annuity at  $4\frac{1}{2}$  per cent.:—

$$\begin{aligned}
 \lambda.A_x.k &= 9.8809436 = .76023 = A_x.k \\
 \lambda.B_x.k^2 &= 8.5220837 = .03327 = B_x.k^2 \\
 \lambda.C_x.k^3 &= 7.0884805 = .00123 = C_x.k^3 \\
 \lambda.D_x.k^4 &= 5.5881519 = .00004 = D_x.k^4 \\
 & & & .79477 \\
 a_{40} \text{ at 5 per cent.} &= 13.35638 & 14.15115 &= a'_{40} \text{ at } 4\frac{1}{2} \text{ per cent. by approximation.} \\
 & & 14.15114 &= a_{40} \text{ at } 4\frac{1}{2} \text{ per cent. by direct calculation from Table 5.}
 \end{aligned}$$

$$\lambda.A_x.k = 0.1840563 = 1.52776 = A_x.k$$

$$\lambda.B_x.k^2 = 9.1283091 = .13437 = B_x.k^2$$

$$\lambda.C_x.k^3 = 7.9978186 = .00995 = C_x.k^3$$

$$\lambda.D_x.k^4 = 6.8006027 = .00063 = D_x.k^4$$

$$1.67271$$

$$a_{40} \text{ at 5 per cent.} = 13.35638$$

$$15.02909 = a'_{40} \text{ at 4 per cent. by approximation.}$$

$$15.02912 = a_{40} \text{ at 4 per cent. by direct calculation from Table 4.}$$

$$\lambda.A_x.k = 0.3622412 = 2.30272 = A_x.k$$

$$\lambda.B_x.k^2 = 9.4846789 = .30527 = B_x.k^2$$

$$\lambda.C_x.k^3 = 8.5323733 = .03407 = C_x.k^3$$

$$\lambda.D_x.k^4 = 7.5133423 = .00326 = D_x.k^4$$

$$2.64532$$

$$a_{40} \text{ at 5 per cent.} = 13.35638$$

$$\lambda.B_x.k^2 = 9.7387609 = .54798 = B_x.k^2$$

$$\lambda.C_x.k^3 = 8.9134963 = .08194 = C_x.k^3$$

$$\lambda.D_x.k^4 = 8.0215063 = .01051 = D_x.k^4$$

$$3.72562$$

$$a_{40} \text{ at 5 per cent.} = 13.35638$$

$$17.08200 = a'_{40} \text{ at 3 per cent. by approximation.}$$

$$17.08322 = a_{40} \text{ at 3 per cent. by direct calculation from Table 2.}$$

In like manner may an Auxiliary Table be formed for Joint Lives. The process is precisely similar to that employed in the construction of Table 21, and needs no further explanation more than observing that a series of difference columns will be needed for each disparity of age. The following specimen has been selected for illustration, in which the disparity of age is fifty years, and it has been deduced from the  $N_{x,y}$  column, Table 14, page 573, in exactly the same manner in which Table 21 was formed from Table 6. By means of Table 22, may Joint Annuities, for all ages in which the disparity of age is 50 years, be determined at any rate of interest. After the preceding illustrations in respect to Single Lives, the following cases for Joint Lives will be easily understood.

In the following examples, in consequence of the Commutation Table from which the calculations are made having been constructed at 7 per cent. the constants  $k, k^2, k^3, \&c. \&c.$  will have a different value from those given in page 597 *ante*, which were prepared so as to apply to a Commutation Table of 5 per cent. In approximating to the

| 50   | 18.5149 | 20.0658  | 96   | 1.9265  | 2.0898   |
| 51   | 17.9144 | 19.4319  | 97   | 1.6197  | 1.7251   |
| 52   | 17.3247 | 18.8091  | 98   | 1.3068  | 1.3446   |
| 53   | 16.7445 | 18.1959  | 99   | .9489   | .9375    |
| 54   | 16.1727 | 17.5915  | 100  | .5000   | .5000    |
| 55   | 15.6075 | 16.9946  |      |         |          |

The above results are deduced from the Report of the Census Commissioners for Ireland, and calculated in the same manner as that described for Tables D and R. The Mortality for the years 1839, 1840 only was taken, in order to avoid the chances of error, connected with the more remote years; as in Ireland, no actual registration of the deaths took place but only were stated from memory at the period of the Census.

# INDEX.
